Soft Computing and Intelligent Systems Design Fakhreddine O. Karray, Clarence W. De Silva, 2004 Traditional artificial intelligence AI techniques are based around mathematical techniques of symbolic logic with programming in languages such as Prolog and LISP invented in the 1960s These are referred to as crisp techniques by the soft computing community The new wave of AI methods seeks inspiration from the world of biology and is being used to create numerous real world intelligent systems with the aid of soft computing tools These new methods are being increasingly taught at the upper end of the curriculum sometimes as an adjunct to traditional AI courses and sometimes as a replacement for them Where a more radical approach is taken and the course is being taught at an introductory level we have recently published Negnevitsky's book Karray and Silva will be suitable for the majority of courses which will be found at an advanced level Karray and de Silva cover the problem of control and intelligent systems design using soft computing techniques in an integrated manner They present both theory and applications including industrial applications and the book contains numerous worked examples problems and case studies Covering the state of the art in soft computing techniques the book gives the reader sufficient knowledge to tackle a wide range of complex systems for which traditional techniques are inadequate

technologies provides complementary methods that allow developing flexible computing tools and solving complex problems. A wide area of natural applications of soft computing techniques consists of the control of dynamic systems including robots. Loosely speaking, control can be understood as driving a process to attain a desired goal. Intelligent control can be seen as an extension of this concept to include autonomous human-like interactions of a machine with the environment. Intelligent robots can be characterized by the ability to operate in an uncertain, changing environment with the help of appropriate sensing. They have the power to autonomously plan and execute motion sequences to achieve a goal specified by a human user without detailed instructions. In this volume, leading specialists address various theoretical and practical aspects in soft computing, intelligent robotics, and control. The problems discussed are taken from fuzzy systems, neural networks, interactive evolutionary computation, intelligent mobile robotics, and intelligent control of linear and nonlinear dynamic systems.
