Hanslmeier, 2006-06-30 In the history of science the opening up of a new observational or experimental window is always followed by an increase in knowledge of the subject concerned This is also the case with the subject of this book ultraviolet radiation hereafter UV In principle the ultraviolet range might be just one more of these windows of no particular importance However the energy per UV photon provides the main peculiarity its magnitude being great enough to produce important chemical reactions in the atmospheres of planets and satellites thereby affecting the transmission of this radiation to the ground The Sun is the main natural source of UV radiation in the Solar System and our planet is the body where its influences can be best tested and the only one where its relation with life can be studied However the terrestrial atmosphere blocks most of the photons in this electromagnetic range and astronomers have had to develop various techniques balloons planes and rockets to cross this barrier and access the information These tools have been used in parallel to investigate the physical properties of the terrestrial atmosphere and the interaction of its constituents with light This book will address most of these topics
