Visual informatics is a field of interest not just among the information technology and computer science community but also other related fields such as engineering medical and health informatics and education starting in the early 1990s Recently the field is gaining more attention from researchers and industry It has become a multi disciplinary and trans disciplinary field related to research areas such as computer vision visualization information visualization real time image processing medical image processing image information retrieval virtual reality augmented reality pervasive visual mathematics 3D graphics multimedia fusion visual data mining visual ontology as well as services and visual culture Various efforts have been vested in different research but operationally many of these systems are not prominent in the mass market and thus knowledge and research on these phenomena within the mentioned areas need to be shared and disseminated It is for this reason that the Visual Informatics Research Group from Universiti kebangsaan Malaysia UKM decided to spearhead this initiative to bring together experts in this very diversified but important research area so that more concerted efforts can be undertaken not just within the visual informatics community in Malaysia but from other parts of the world namely Asia Europe Oceania and USA This first International Visual Informatics Conference IVIC 2009 was conducted collaboratively by the visual informatics research community from the various public and private institutions of higher learning in Malaysia and hosted by UKM

Information Systems Joyce Fortune, Geoff Peters, 2005 Despite people's best efforts information systems are particularly prone to failure Some systems never materialize others appear late and/or over budget and those that are

implemented often fail to deliver the promised levels of performance. The consequences of these failures affect people throughout the organization concerned and beyond sometimes to the point where they even threaten a company's future survival.

User Participation and the Success of Information System Development Lei Lei, 1994

The Impact of Users' Expectations on the Success of Information Technology Implementation Barbara L. Marcolin, 1994

Information Technology (IT) is being used to enhance productivity and effectiveness in response to today's competitive business pressures. However, there still exists a gap between what users expect and get from IT. As a result, this technology may not be helping users respond to the challenges in the business environment. In an effort to improve IT implementation by addressing users' expectations, Disconfirmation Theory, adapted from the consumer behaviour literature, is cast in an Information Systems (IS) setting. This theory helps understand how a deviation between users' expectations and IT performance can lead to IS success or failure. This theoretical foundation is used to address the IT implementation processes and enhance the value of that technology for the organization and the users. Based upon three longitudinal field studies and eleven cross-sectional field studies, it was found that meeting users' expectations (i.e., low disconfirmation) had a greater impact on IS success than users' expectations or users' post-implementation evaluation of the system's performance alone. The users' most important expectations included perceived usefulness, relative advantage, impact on knowledge, analytic capability, strategic orientation, fit or compatibility, ease of use, and contribution to the user's image profile and value as an employee. Managers and system designers can evaluate these important dimensions early in the system development cycle to assess the fit and hence the likelihood of success. Changes can be made to improve the system's impact. Researchers can employ the synthesized expectations categories which were aggregated from previous work on IS expectations, attitude theories, and diffusion of innovations work to build a cumulative tradition based on common constructs.
