**Processing** A. Nejat Ince, 1991-10-31 After almost three scores of years of basic and applied research the field of speech processing is at present undergoing a rapid growth in terms of both performance and applications and this is fuelled by the advances being made in the areas of microelectronics computation and algorithm design. Speech processing relates to three aspects of voice communications: Speech Coding and transmission which is mainly concerned with man to man voice communication; Speech Synthesis which deals with machine to man communication; Speech Recognition which is related to man to machine communication. Widespread application and use of low bit rate voice codec synthesizers and recognizers which are all speech processing products requires ideally internationally accepted quality assessment and evaluation methods as well as speech processing standards so that they may be interconnected and used independently of their designers and manufacturers without costly interfaces. This book presents in a tutorial manner both fundamental and applied aspects of the above topics which have been prepared by well known specialists in their respective areas. The book is based on lectures which were sponsored by AGARD NATO and delivered by the authors in several NATO countries to audiences consisting mainly of academic and industrial R D engineers and physicists as well as civil and military C3I systems planners and designers. 1997 IEEE International Conference on Acoustics, Speech, and Signal Processing: Statistical signal and array processing, applications, 1997
