**Utilisation of Excess Heat Towards a Circular Economy** Sofia Päivärinne, 2017-11-23

In order to significantly lower the environmental impact from human activities numerous efforts and approaches related to the transformation of human activities have developed during the last decades Examples of such efforts are policies and strategies at different levels some with a top down approach focusing on extensive institutional changes and some with a bottom up approach focusing on industrial actors and industry led activities One essential aspect of these efforts concerns the energy used producing the products and services provided within our society This includes for example improved efficiency of processes in order to minimise the amount of energy used or optimisation of efficiency by using energy with the lowest possible exergy value It can also be about re use of energy which is the focus of this thesis Heat which is the main by product of all energy systems can be utilised for heating purposes to lower the primary energy demand for heating Increased utilisation of excess heat however requires collaboration between normally unrelated actors those with a supply of and those demanding excess heat In Sweden which is a Northern European country with high demand for heat the tradition of large energy intensive manufacturing industries generating large amounts of excess heat in combination with well established district heating distribution systems constitute good conditions for excess heat utilisation Despite the fact that Sweden is among the world leaders in utilising excess heat there is however still a large unutilised potential From this background the objective of this thesis is to identify challenges behind excess heat utilisation for heating purposes and to propose practical suggestions to facilitate expanded excess heat utilisation The overall objective is analysed with a focus on drivers and barriers behind interorganisational collaborations on excess heat utilisation important components of interorganisational business models and how the technical conditions regarding supply and demand could be facilitated by strategic municipal spatial planning processes The research is largely based on interviews conducted with societal actors with different perspectives on excess heat utilisation energy companies industries generating high grade excess heat facilities generating low grade excess heat facilities demanding low grade excess heat experts of utilisation of low grade excess heat branch organisations municipal spatial planners energy and climate advisors and developers Document studies have been conducted in order to collect case specific knowledge The research questions are explored based on literature studies on the principles of industrial symbiosis business model perspective and strategic planning Further they are examined in a Swedish context It is concluded that the three perspectives complement each other by providing a system perspective on increased utilisation of excess heat as they seek to contribute both environmental and financial benefits at both a company and societal level In order to facilitate further utilisation of excess heat it is important to focus on the organisational factors of humility honesty transparency trust fine grained information transfer joint problem solving and

shared visions of common goals which are important conditions behind development of functional and long term durable collaborations Business models for collaboration could contribute to the creation of these organisationally important conditions Such business models could also provide knowledge on how to create and capture joint values For some collaborations involving actors lacking the technical knowledge related to the capturing and distribution of excess heat a third party providing services related to the technical knowledge required could be beneficial Collaborations in which one of the actors consists of an energy company often entail the technical knowledge required This implies that different collaborations involving different types of actors and under different prevailing financial technical and organisational conditions require customised and flexible business solutions Local authorities could through their overall function initiate interorganisational collaborations on excess heat within the framework of municipal spatial planning The results do however show that the investigated planning processes could develop more extensive stakeholder participation to include further societal actors related to excess heat More extensive stakeholder participation have the potential to initiate new development of collaborations on excess heat between normally unrelated actors both with and without involvements of third party knowledge brokers A broader participation is also expected to result in increased knowledge on how to plan to further facilitate the condition of excess heat utilisation

*The Planner* ,1990 **Circular Economy: Global Perspective** Sadhan Kumar Ghosh,2019-11-01 A circular economy is an alternative to a traditional linear economy make use dispose in which we keep resources in use for as long as possible extract the maximum value from them whilst in use then recover and regenerate products and materials at the end of each service life Circular economy CE is important towards sustainable development

resources circulation and conservation involving closing of material loops and cascading used resources to prevent waste occurrence and transforming the resulting residual streams into new secondary resources Strategies and legislative framework for waste management are important steps for development of a more CE where resource efficiency becomes the key driver for both economic growth and environmental protections A few countries achieved good results implementing CE as a replacement of the linear economy Resource managers and planners should thoroughly identify factors to implement CE for societal benefits This book presents how resource consumption is minimized with rational use based on 3Rs legislative framework and government supports towards implementing CE initiatives example of best practices future plans and targets in different countries those are helpful for researchers planners and implementers

**A Future for Planning** Michael Harris, 2019-04-25 As well as being spatial planning is necessarily also about the future and yet time has been relatively neglected in the academic practice and policy literature on planning Time in particular the need for longer term thinking is critical to responding effectively to a range of pressing societal challenges from climate change to an ageing population poor urban health to sustainable economic development This makes the relative neglect of time not only a matter of theoretical importance but also increasing practical and political significance A Future for Planning is an accessible wide ranging book that considers how planning practice and policy have been constrained by short termism as well as by a familiar lack of spatial thinking in policy in response to major social economic and environmental challenges It suggests that failures in planning often represent failures to anticipate and shape the future which go well beyond planning systems and practices rather our failure to plan for the longer term relates to wider issues in policy making and governance This book traces the rise and fall of long term planning over the past 80 years or so but also sets out how planning can take responsibility for twenty first century challenges It provides examples of successes and failures of longer term planning from around the world In short the book argues that we need to put time back into planning and develop forms of planning which serve to promote the sustainability and wellbeing of future generations

**Essays on Pollution Control in Economics and Management Science** Fouad El Ouardighi, 2025-04-25 The book features contributions that address both environmental economics and environmental management It presents a novel dynamic modeling framework for environmental economics in which environmental absorption efficiency is considered as a time dependent variable with its own dynamics It also introduces several extensions and applications of the model including the possibility of including self regenerating environmental absorption efficiency non cooperative transboundary issues with two superimposed free rider behaviors i e emissions reduction and restoration efforts and deforestation In the environmental management context it puts forward an entirely new dynamic modeling framework Unlike static approaches the model considers both flow and stock variables reflecting the accumulation of pollution over time In turn the book assesses sustainable configurations for supply chain competition providing mathematical insights and managerial recommendations that integrate accumulated pollution aspects and

associated negative externalities Overall the book calls for combining environmental economics and environmental management in order to arrive at more realistic empirically grounded models Given its focus the book offers a valuable resource for researchers and graduate students with an interest in addressing pollution control challenges in the fields of economics and management science
