## **Terrestrial Heat Flow:**

*Terrestrial Heat Flow in Europe* V. Cermak, L. Rybach, 2012-12-06 The outflow of heat from the earth's interior, the terrestrial heat flow and the temperature field at depth are determined by deep seated tectonic processes. The knowledge of the regional heat flow pattern is thus very important in geophysics and provides a useful tool for studying crustal and lithospheric structure and understanding the nature of their evolution. In order to use the results of heat flow measurements for regional studies and/or to correlate the observed surface geothermal activity with other geophysical or geological features, a map showing the surface distribution of heat flow is necessary. Since 1963 when the first comprehensive listing of all available heat flow data appeared (Lee, 1963), several attempts have been made to update the list, to classify all the data and to interpret them with respect to tectonics, deep structure and to use them for constructing surface heat flow maps. The first listing was subsequently revised by Lee and Uyeda (1965), numerous new data which were published thereafter were included in successive catalogs compiled by Simmons and Horai (1968) and then again by Jessop et al. (1976). The map showing the surface heat flow pattern may also be of great value for practical purposes in view of the recent world-wide search for applicable sources of geothermal energy.

**Handbook of Terrestrial Heat-Flow Density Determination** R. Haenel, L. Stegena, L. Rybach, 2012-12-06 There comes a time in the affairs of every organization when we have to sit down and take stock of where we are and where we want to go. When the International Heat Flow Committee, as it was first called IHFC, was formed in 1963 at the San Francisco International Union of Geodesy and Geophysics with Francis Birch as its first Chairman, the principal purpose was to stimulate work in the basic aspects of geothermics, particularly the measurement of terrestrial heat flow density (HFD) in what were then the geothermally underdeveloped areas of the world. In this, the IHFC was remarkably successful. By the beginning of the second decade of our existence, interest in the economic aspects of geothermics was increasing at a rapid pace and the IHFC served as a conduit for all aspects of geothermics and moreover became the group responsible for collecting data on all types of HFD measurements. In all the tasks that are undertaken, the IHFC relies on the enthusiasm of its members and colleagues who devote much of their time to the important but unglamorous and personally unrewarding tasks that were asked of them and we are fortunate that our parent institutions are usually quite tolerant of the time spent by their employees on IHFC work.

**Terrestrial Heat Flow and the Lithosphere Structure** Vladimir Cermak, L. Rybach, 2012-12-06 *Terrestrial Heat Flow and the Lithosphere Structure* summarizes current problems of analyzing related data. The individual chapters are written by leading scientists in geothermics and are arranged in three sections: General Lithospheric Geothermics, Regional Lithospheric Geothermics, Worldwide Heat Flow Density Studies. Emphasis is laid on the interrelations between lithospheric structure and local heat flow fields. [Terrestrial Heat Flow](#) William Hung Kan Lee, International Union of Geodesy and Geophysics.
