*Applications of Wet-End Paper Chemistry* Che On Au,I. Thorn,2013-06-29 Commercial demands and increasing global competition have led to enormous mechanical evolution over recent years Twin wires wide nip presses steam boxes and speed sizers have all played a part in improving both the productivity and quality of paper and board products With the emphasis on mechanical and electrical engineering and the ever increasing pressures of quality measurement and control little time has been available within a technical department for much reflection on the chemistry of the process Thus there is a growing trend for the management of the wet end to be delegated to the chemical supplier The advances in scale of paper manufacture environmental sensitivity and higher quality of end product requirements have all had an impact on the chemistry of the wet end The increased production means for example that down time is more of an anathema now when capacity is critical Similarly with the greater rigours of quality management anything which causes breaks or holes must be eradicated Environmental pressures too are growing on the papermaking process Even if consideration is restricted to only the closure of the white water circuit it alone throws down a challenge to the potency of biocides retention aids and other chemicals These chemicals are detriment ally affected by an increasing concentration of water soluble pulp extractives and surfactants adhesives and polysaccharides from broke and recycled paper      Applications of Wet-End Paper Chemistry Ian Thorn,Che On Au,2009-07-24 *Applications of Wet end Paper Chemistry* bridges the gap between the theory and practice of wet end paper chemistry by explaining how particular chemicals are chosen and put to use in real situations A number of international experts in the field present recent contributions on the optimum use of chemicals in papermaking Major inroads have taken place since the first edition of this title was published in 1995 This new edition of *Applications of Wet end Paper Chemistry* will reflect the changing type and use of chemicals used in papermaking in the 21st century Chemists and chemical engineers across the paper and pulp making industry as well as in research and academic institutes will find this book of enormous practical value      **Paper Products Physics and Technology** Monica Ek,Göran Gellerstedt,Gunnar Henriksson,2009-12-15 This four volume set covers the entire spectrum of pulp and paper chemistry and technology from starting material to processes and products including market demands This work is essential for all students of wood science and a useful reference for those working in the pulp and paper industry or on the chemistry of renewable resources This volume examines the physical properties of paper and modern demands on this versatile material The book presents fundamental definitions of fibre networks and their structure physical properties of the paper and their development during pressing and drying interactions with moisture and its affect on mechanical properties interactions between light and fibrous materials and the determination of optical properties of the paper physical action of dry strength and wet strength chemicals physical properties of the paper surface with special emphasis on printing and print quality overview of packaging materials

**Paper Chemistry** J.C. Roberts, 2012-12-06 Although the title of this book is Paper Chemistry it should be considered as a text about the chemistry of the formation of paper from aqueous suspensions of fibre and other additives rather than as a book about the chemistry of the raw material itself It is the subject of what papermakers call wet end chemistry There are many other excellent texts on the chemistry of cellulose and apart from one chapter on the accessibility of cellulose the subject is not addressed here Neither does the book deal with the chemistry of pulp preparation from wood from other plant sources or from recycled fibres for there are also many excellent texts on this subject The first edition of this book was a great success and soon became established as one of the Bibles of the industry Its achievement then was to collect the considerable advances in understanding which had been made in the chemistry of papermaking in previous years and provide for the first time a sound physico chemical basis of the subject This new edition has been thoroughly updated with much new material added The formation of paper is a continuous filtration process in which cellulosic fibres are formed into a network which is then pressed and dried The important chemistry involved in this process is firstly the retention of colloidal material during filtration and secondly the modification of fibre and sheet properties so as to widen the scope for the use of paper and board products
