Algorithms for Elliptic Problems Marián Vajtersic, 2013-03-09 This volume deals with problems of modern effective algorithms for the numerical solution of the most frequently occurring elliptic partial differential equations From the point of view of implementation attention is paid to algorithms for both classical sequential and parallel computer systems The first two chapters are devoted to fast algorithms for solving the Poisson and biharmonic equation In the third chapter parallel algorithms for model parallel computer systems of the SIMD and MIMD types are described The implementation aspects of parallel algorithms for solving model elliptic boundary value problems are outlined for systems with matrix pipeline and multiprocessor parallel computer architectures A modern and popular multigrid computational principle which offers a good opportunity for a parallel realization is described in the next chapter More parallel variants based in this idea are presented whereby methods and assignments strategies for hypercube systems are treated in more detail The last chapter presents VLSI designs for solving special tridiagonal linear systems of equations arising from finite difference approximations of elliptic problems For researchers interested in the development and application of fast algorithms for solving elliptic partial differential equations using advanced computer systems

Proceedings of the Seventh SIAM Conference on Parallel Processing for Scientific Computing David H. Bailey, 1995-01-01 **Proceedings Parallel Computing** **An Efficient Parallel Multigrid Solver for 3-D Convection-dominated Problems** Ignacio M. Llorente, 2000 Multigrid algorithms are known to be highly efficient in solving systems of elliptic equations However standard multi grid algorithms fail to achieve optimal grid independent convergence rates in solving non elliptic problems In many practical cases the non elliptic part of a problem is represented by the convection operator Downstream marching when it is viable is the simplest and most efficient way to solve this operator However in a parallel setting the sequential nature of marching degrades the efficiency of the algorithm The aim of this report is to present evaluate and analyze an alternative highly parallel multi grid method for 3 D convection dominated problems This method employs semi coarsening a four color plane implicit smoother and discretization rules allowing the same cross characteristic interactions on all the grids involved to be maintained The resulting multigrid solver exhibits a fast grid independent convergence rate for solving the convection diffusion operator on cell centered grids with stretching The load imbalance below the critical level is the main source of inefficiency in its parallel implementation A hybrid smoother that degrades the convergence properties of the method but improves its granularity has been found to be the best choice in a parallel setting The numerical and parallel properties of the multi grid algorithm with the four color and hybrid smoothers are studied on SGI Origin 2000 and Cray T3E systems **Forthcoming Books** Rose Army, 1992
