Spect In Dementia:

SPECT in Dementia K. P. Ebmeier, 2003-08-08 Single photon emission computerized tomography SPECT is a relatively cheap and widely available instrument for the examination of brain perfusion cerebral blood flow and activity of neurotransmitter systems The European project SPECT in dementia sets out to overcome some of the factors holding back the development of clinical neuroimaging It has developed a methodology for combining results from different imaging centres at the same time making scan assessment more objective and powerful Moreover using objective voxel based methods of image analysis improves the diagnostic performance of less experienced clinicians and contributes to their training This publication gives an excellent general overview of the new methods of image analysis and sharing It is complemented by a systematic review of the diagnostic utility of SPECT in dementia and a cost effectiveness model of diagnostic improvements in Alzheimer s disease This book is essential reading for all scientists economists and clinicians in geriatric medicine neurology and psychiatry neuro radiology and nuclear medicine working with patients suffering from dementia and Alzheimer s disease who want to stay ahead in this rapid developing field *Physiological Imaging with PET and SPECT in Dementia*, 1989 Dementia is a medical problem of increasingly obvious importance The most common cause of dementia Alzheimer s disease AD accounts for at least 50% of all cases of dementia with multi infarct dementia the next most common cause of the syndrome While the accuracy of diagnosis of AD may range from 80 to 90% there is currently no laboratory test to confirm the diagnosis Functional imaging techniques such as positron emission tomography PET and single photon emission computed tomography SPECT offer diagnostic advantages since brain function is unequivocally disturbed in all dementing illnesses Both PET and SPECT have been utilized in the study of dementia While both techniques rely on principles of emission tomography to produce three dimensional maps of injected radiotracers the differences between positron and single photon emission have important consequences for the practical applications of the two procedures This book briefly reviews the technical differences between PET and SPECT and discusses how both techniques have been used in our laboratory to elucidate the pathophysiology of dementia 32 refs 2 figs *Imaging in Neurodegenerative Disorders* Luca Saba, 2015 Diagnosing neurodegenerative diseases can prove particularly intimidating to clinicians because many times the diagnosis cannot be critically confirmed by a simple test New imaging modalities have advanced to the point of high resolution morphological metabolic and functional analysis Computed tomography magnetic resonance nuclear medicine and molecular imaging have recently emerged as outstanding non invasive techniques for the study of the neurodegenerative disorders *Imaging in Neurodegenerative Disorders* covers all the imaging techniques and new exciting methods like new tracers biomarker metabolomic and gene array profiling potential for applying such techniques clinically and offers present and future applications as applied to the neurodegenerative disorders with the most world renowned scientists in these fields This book is an invaluable resource for researchers clinicians and trainees in neuroscience neurology psychiatry and

Casanova,Mikhail Lebedev,Ioan Opris ,2018-09-14 The final volume in this tripartite series on Brain Augmentation is entitled From Clinical Applications to Ethical Issues and Futuristic Ideas Many of the articles within this volume deal with translational efforts taking the results of experiments on laboratory animals and applying them to humans In many cases these interventions are intended to help people with disabilities in such a way so as to either restore or extend brain function Traditionally therapies in brain augmentation have included electrical and pharmacological techniques In contrast some of the techniques discussed in this volume add specificity by targeting select neural populations This approach opens the door to where and how to promote the best interventions Along the way results have empowered the medical profession by expanding their understanding of brain function Articles in this volume relate novel clinical solutions for a host of neurological and psychiatric conditions such as stroke Parkinson s disease Huntington s disease epilepsy dementia Alzheimer s disease autism spectrum disorders ASD traumatic brain injury and disorders of consciousness In disease symptoms and signs denote a departure from normal function Brain augmentation has now been used to target both the core symptoms that provide specificity in the diagnosis of a disease as well as other constitutional symptoms that may greatly handicap the individual The volume provides a report on the use of repetitive transcranial magnetic stimulation rTMS in ASD with reported improvements of core deficits i e executive functions TMS in this regard departs from the present day trend towards symptomatic treatment that leaves unaltered the root cause of the condition In diseases such as schizophrenia brain augmentation approaches hold promise to avoid lengthy pharmacological interventions that are usually riddled with side effects or those with limiting returns as in the case of Parkinson s disease Brain stimulation can also be used to treat auditory verbal hallucination visuospatial hemispatial neglect and pain in patients suffering from multiple sclerosis The brain acts as a telecommunication transceiver wherein different bandwidth of frequencies brainwave oscillations transmit information Their baseline levels correlate with certain behavioral states The proper integration of brain oscillations provides for the phenomenon of binding and central coherence Brain augmentation may foster the normalization of brain oscillations in nervous system disorders These techniques hold the promise of being applied remotely under the supervision of medical personnel thus overcoming the obstacle of travel in order to obtain healthcare At present traditional thinking would argue the possibility of synergism among different modalities of brain augmentation as a way of increasing their overall effectiveness and improving therapeutic selectivity Thinking outside of the box would also provide for the implementation of brain to brain interfaces where techniques proper to artificial intelligence could allow us to surpass the

limits of natural selection or enable communications between several individual brains sharing memories or even a global brain capable of self organization Not all brains are created equal Brain stimulation studies suggest large individual variability in response that may affect overall recovery treatment or modify desired effects of a given intervention The subject's age gender hormonal levels may affect an individual's cortical excitability In addition this volume discusses the role of social interactions in the operations of augmenting technologies Finally augmenting methods could be applied to modulate consciousness even though its neural mechanisms are poorly understood Finally this volume should be taken as a debate on social moral and ethical issues on neurotechnologies Brain enhancement may transform the individual into someone or something else These techniques bypass the usual routes of accommodation to environmental exigencies that exalted our personal fortitude learning exercising and diet This will allow humans to preselect desired characteristics and realize consequent rewards without having to overcome adversity through more laborious means The concern is that humans may be playing God and the possibility of an expanding gap in social equity where brain enhancements may be selectively available to the wealthier individuals These issues are discussed by a number of articles in this volume Also discussed are the relationship between the diminishment and enhancement following the application of brain augmenting technologies the problem of mind control with BMI technologies free will the duty to use cognitive enhancers in high responsibility professions determining the population of people in need of brain enhancement informed public policy cognitive biases and the hype caused by the development of brain augmenting approaches

Freeman, 2008-01-03 The modern era of radionuclide imaging and therapy is well into its seventh decade During this era many national and international textbooks have been published in an attempt to educate not only the practitioners of our medical discipline but also referring physicians and medical students Some of the more recent large multic tural texts such as those by Ell and Ghambir Sandler et al and Henkin et al provide us with very comprehensive reference sources while some of the smaller texts totally written by two or three individuals e g Mettler Guiberteau and Ziessman O M ley Thrall have achieved popularity with radiology residents and other physicians in training The concept of Clinical Nuclear Medicine arose 3 years ago from a

conversation between the editors who have been close friends for many years We have always felt that our relationship epitomizes one of the major strengths of nuclear medicine which is the very close ties and spirit of educational cooperation that exist between international colleagues We all share the same aim of doing whatever we can to optimize patient care whether it be by introducing new pharmaceuticals and instruments or by developing new techniques or approaches to performing our broad spectrum of clinical procedures Nuclear medicine physicians have almost uniformly been willing to share their expertise at national and international meetings The international nuclear medicine community unlike many other larger specialty areas has remained relatively small It was within this spirit that Clinical Nuclear Medicine was born
