Strange Functions In Real Analysis:

Strange Functions in Real Analysis Alexander Kharazishvili, 2017-10-16 *Strange Functions in Real Analysis* Third Edition differs from the previous editions in that it includes five new chapters as well as two appendices More importantly the entire text has been revised and contains more detailed explanations of the presented material In doing so the book explores a number of important examples and constructions of pathological functions After introducing basic concepts the author begins with Cantor and Peano type functions then moves effortlessly to functions whose constructions require what is essentially non effective methods These include functions without the Baire property functions associated with a Hamel basis of the real line and Sierpinski Zygmund functions that are discontinuous on each subset of the real line having the cardinality continuum Finally the author considers examples of functions whose existence cannot be established without the help of additional set theoretical axioms On the whole the book is devoted to strange functions and point sets in real analysis and their applications

Strange Functions in Real Analysis, Second Edition Alexander Kharazishvili, 2005-12-20 Weierstrass and Blancmange nowhere differentiable functions Lebesgue integrable functions with everywhere divergent Fourier series and various nonintegrable Lebesgue measurable functions While dubbed strange or pathological these functions are ubiquitous throughout mathematics and play an important role in analysis not only as counterexamples of seemingly true and natural statements but also to stimulate and inspire the further development of real analysis *Strange Functions in Real Analysis* explores a number of important examples and constructions of pathological functions After introducing the basic concepts the author begins with Cantor and Peano type functions then moves to functions whose constructions require essentially noneffective methods These include functions without the Baire property functions associated with a Hamel basis of the real line and Sierpinski Zygmund functions that are discontinuous on each subset of the real line having the cardinality continuum Finally he considers examples of functions whose existence cannot be established without the help of additional set theoretical axioms and demonstrates that their existence follows from certain set theoretical hypotheses such as the Continuum Hypothesis

Generic Continuous Functions and Other Strange Functions In Classical Real Analysis Douglas Albert Woolley,2008 In this paper we examine continuous functions which on the surface seem to defy well known mathematical principles Before describing these functions we introduce the Baire Category theorem and the Cantor set which are critical in describing some of the functions and counterexamples We then describe generic continuous functions which are nowhere differentiable and monotone on no interval and we include an example of such a function We then construct a more conceptually challenging function one which is everywhere differentiable but monotone on no interval We also examine the Cantor function a nonconstant continuous function with a zero derivative almost everywhere The final section deals with products of derivatives

Topics in Measure Theory and Real Analysis A. B. Kharazishvili,2009 This book highlights various topics on measure theory and vividly demonstrates that the different questions of this theory are closely connected with the central measure extension problem Several important aspects of the measure extension problem are considered separately set theoretical topological and algebraic Also various combinations e g algebraic topological of these aspects are discussed by stressing their specific features Several new methods are presented for solving the above mentioned problem in concrete situations In particular the following new results are obtained the measure extension problem is completely solved for invariant or quasi invariant measures on solvable uncountable groups non separable extensions of invariant measures are constructed by using their ergodic components absolutely non measurable additive functionals are constructed for certain classes of measures the structure of algebraic sums of measure zero sets is investigated The material presented in this book is essentially self contained and is oriented towards a wide audience of mathematicians including postgraduate students New results and facts given in the book are based on or closely connected with traditional topics of set theory measure theory and general topology such as infinite combinatorics Martin s Axiom and the Continuum Hypothesis Luzin and Sierpinski sets universal measure zero sets theorems on the existence of measurable selectors regularity properties of Borel measures on metric spaces and so on Essential information on these topics is also included in the text primarily in the form of Appendixes or Exercises which enables potential readers to understand the proofs and follow the constructions in full details This not only allows the book to be used as a monograph but also as a course of lectures for students whose interests lie in set theory real analysis measure theory and general topology

Real Analysis Russell A. Gordon,2002 This text presents ideas of elementary real analysis with chapters on real numbers sequences limits and continuity differentiation integration infinite series sequences and series of functions and point set topology Appendixes review essential ideas of mathematical logic sets and functions and mathematical induction Students are required to confront formal proofs Some background in calculus or linear or abstract algebra is assumed This second

edition adds material on functions of bounded variation convex functions numerical methods of integration and metric spaces
