**North American Model of Wildlife Conservation** Anja Heister,2022-10-26 The North American Wildlife Conservation  
Model NAM is the driver of a strong anthropocentric stance which has legalized an ongoing annual exploitation of hundreds  
of millions of wild animals who are killed in the United States through trapping hunting and other lethal practices  
Increasingly the American public opposes the killing of wild animals for recreation trophies and profit but has little if any  
knowledge of the Model The purpose of this book is to empower the public with knowledge about the NAM s insufficiencies  
and to help expedite the shift from lethal to compassionate conservation an endeavour urgently needed particularly under  
the threats of climate change human population growth and accelerating plant and animal species extinctions With a focus  
on trapping this book exposes the NAM s belief in human supremacy and its consequences for wild animals and their  
ecosystems the same value that is driving the ongoing global destruction of nature and accelerating species extinction  
Motivated by a deep concern for wild animals who suffer and whose lives are extinguished each year by sportsmen and  
women this book exposes the violent treatment of wild animals inherent in governmental promoted hunting and trapping  
programs while emphasizing the importance of empathy and compassion for other animals in conservation and in our lives

Strehler,Mead B. Wetherbe,1956 A new experimental procedure was used in the open shot of Operation Teapot to study  
various properties of secondary missiles produced in houses shelters and open areas at distances of 1470 to 10 500 ft from a  
nuclear explosion with a yield approximately 50 per cent greater than nominal The experimental technique involved trapping  
the missiles in an absorbing material consisting of Styrofoam 22 Laboratory calibrations of the Styrofoam made it possible to  
determine individual velocities for the trapped missiles Velocities were calculated for 2611 missiles 95 per cent of which  
were window glass fragments obtained from 27 traps Missile velocities masses and spatial distributions were analyzed  
statistically Computational procedures were proposed to predict the velocities of stone missiles in open areas from blast data  
and from assumed average aerodynamic constants for stones The method was tested for the 5 psi overpressure region The  
computed predicted velocities showed satisfactory correspondence with those empirically determined from data obtained

from a missile trap placed in this region
