

SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using miombo woodland as an example – a forest type found across much of southern Africa.

8 Every species – including humans – contributes to ecosystem balance. Disturbing this balance can cause more negative consequences. For example, if natural habitat is reduced by humans, invasive animals like baboons and elephants may threaten existing people's farms, leading to community tensions. Disturbing habitat also increases the risk of disease transfer to humans.

7 There is a constant cycle of life and death, with many species helping dispose of dead matter, keeping the environment clean and healthy. For example, vultures dispose of carcasses, helping prevent the spread of diseases like anthrax and rabies.

6 A healthy ecosystem has a balance of predators that keep pest populations under control. For example, crocodiles, such as hippos and giraffes eat rodents, keeping their populations low. Many reptiles and amphibians reduce the number of insect pest insects such as mosquitoes and flies.

1 Plants absorb carbon dioxide from the air and release oxygen that animals need to survive. Plants store carbon in their leaves, bark, and roots as well as in the soil around them. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Plants help maintain water supplies by moving and releasing moisture, including floods and droughts.

2 Plants use energy from the sun, to convert carbon dioxide and water into glucose. This is the basis of food for almost all species in the world. Herbivores like elephants and antelopes eat plants and they eat because food for omnivores like lions and wild dogs.

3 Flowering plants need to be pollinated to reproduce. Different species of insects, birds and mammals pollinate different plants. For example bats and moths pollinate baobab trees and many ornamental species are pollinated by bees.

4 Many plants rely on animals to disperse their seeds, enabling the plants to grow. For example elephants, primates and birds eat fruit that disperses the seeds, fertilised by their dung, far from the parent plant.

5 Nature recycles everything, with many different species contributing to nutrient transfer. For example, dung decomposition and bury, forming cycling nutrients back into the soil. Millipedes feed on dead and decaying organic matter and transfer nutrients through their droppings.

Transpecies Design Adrian Parr Zaretsky, Michael Zaretsky, 2024-07-31 In May 2019 the United Nations released the Global Assessment Report on Biodiversity and Ecosystem Services which warned that human activities will drive nearly one million species to extinction in a few decades The primary reasons for this are habitat loss and biodiversity demise caused by changing climate pollution introducing nonindigenous species clearing land over population and consumption Given this situation humans must change course as both human wellbeing and the wellbeing of other than human species are imbricated in one another One way humanity can accomplish the needed transformation is to move beyond an anthropocentric view of life by embracing a transpecies approach that is premised upon interconnected flourishing Transpecies design as outlined in this book offers a new approach to regenerating the natural environment while honoring biodiversity Rather than presenting the human experience as the goal of design transpecies design takes the inextricable linkages connecting living things as both its starting point and end goal As such it moves beyond human experience serving as the fundamental ingredient for making better design processes and decisions This book is essential reading for artists designers and architects as well as students of architecture landscape architecture interior architecture art product design urban design planning environmental philosophy and cultural studies

An Introductory Philosophy of Medicine James A. Marcum, 2008-05-07 In this book the author explores the shifting philosophical boundaries of modern medical knowledge and practice occasioned by the crisis of quality of care especially in terms of the various humanistic adjustments to the biomedical model To that end he examines the metaphysical epistemological and ethical boundaries of these medical models He begins with their metaphysics analyzing the metaphysical positions and presuppositions and ontological commitments upon which medical knowledge and practice is founded Next he considers the epistemological issues that face these medical models particularly those driven by methodological procedures undertaken by epistemic agents to constitute medical knowledge and practice Finally he examines the axiological boundaries and the ethical implications of each model especially in terms of the physician patient relationship In a concluding Epilogue he discusses how the philosophical analysis of the humanization of modern medicine helps to address the crisis of care as well as the question of What is medicine The book s unique features include a comprehensive coverage of the various topics in the philosophy of medicine that have emerged over the past several decades and a philosophical context for embedding bioethical discussions The book s target audiences include both undergraduate and graduate students as well as healthcare professionals and professional philosophers This book is the 99th issue of the
