

General relativity

From the world learned of the revolutionary Special Theory of Relativity proposed by Albert Einstein and published in 1905, physics underwent its most revolutionary change since the days of Isaac Newton. Nevertheless, Einstein had yet another surprise left: the so-called General Theory of Relativity, of 1916—a much more complex and complete theory from which several interesting predictions arise and have been confirmed over time.

Why a second theory?

According to Einstein, the laws of physics are the same for all observers, but the way they are perceived is different. Einstein's theory of relativity is a generalization of Newton's theory of gravity, which is only valid in the case of weak gravitational fields. Einstein solved the problem of providing an theory by providing an equivalent principle.

A deformed universe

Einstein established that gravity was not a force, but rather the consequence of the deformation of space-time that any body with mass generates. Mass, when accumulating in a star, for example, an object is not affected by any force, but it travels through that curved deformation.

The most fundamental principle of general relativity is that the laws of physics are the same for all observers.

Light that bends

Perhaps the most surprising confirmation of one of Einstein's predictions, based on the General Theory of Relativity, happened in 1919 during the course of a solar eclipse.

According to the general theory of relativity, the path of light is curved by the presence of mass. This was confirmed during the solar eclipse of 1919, when the light from the stars was observed to be deflected by the Sun's gravity.

In 1919, the British astronomer Arthur Eddington led an expedition to observe the solar eclipse of May 29, 1919. He measured the deflection of starlight by the Sun's gravity, which confirmed Einstein's theory.

4 dimensions

For the universe according to Einstein's theory, although the space is three-dimensional, time is the fourth dimension, forming a four-dimensional spacetime.

76 years

After 76 years, the theory of relativity is still one of the most important theories in physics.

Gravitational lenses

Another prediction based on the General Theory of Relativity concerns gravitational lenses. Because of the deformation, which is also related to the attractive interaction caused by gravity, the image of certain far stars and galaxies is distorted when seen from the Earth.

The lensing effect is observed when a massive object, such as a galaxy cluster, passes between a distant galaxy and the Earth. The gravity of the lensing object bends the light from the background galaxy, creating multiple images.

Gravitational lensing is a powerful tool for studying distant galaxies and dark matter. It can also be used to detect exoplanets and other celestial objects.

HERSCHEL & LORRY

The image shows a gravitational lensing effect. The lensing object is a galaxy cluster, and the background galaxy is a spiral galaxy. The lensing effect creates multiple images of the background galaxy, which are seen as multiple copies of the same galaxy.

Electromagnetic waves

Einstein proposed that an intense gravitational field could produce the deflection of waves, in other words, this would make them lose energy. Because waves "travel" when being moving, that is, they become matter, this effect would cause a redshift in the observed frequency wave.

Perturbation of Mercury's orbit

Astronomers had discovered a discrepancy in the observed position of the planet Mercury that could not be explained by Newtonian or classical physics without including some hypothetical planet. Einstein used his theory to explain the discrepancy, obtaining the position of the missing planet.

The discrepancy was first noticed in the 19th century by astronomers. It was not until Einstein's theory of general relativity that the discrepancy was explained. The theory predicted that the orbit of Mercury would be perturbed by the Sun's gravity, which was confirmed by observations.
