Small Shoot:

Cryopreservation of Plant Germplasm II L.E. Towill, Y.P.S. Bajaj, 2013-03-14 Ex situ preservation of germplasm for higher plant species has been accomplished using either seeds or clones but storage of these under typical conditions does not provide the extreme longevities that are needed to minimize risk of loss. Costs of maintenance and regeneration of stocks are also high. Systems that provide virtually indefinite storage should supplement existing methods and it is within this context that cryopreservation is presented. The use of low temperature preservation was initially more a concern of medicine and animal breeding and was expanded to plants in the 1970s. Survival after cryogenic exposure has now been demonstrated for diverse plant groups including algae, bryophytes, fungi, and higher plants. If survival is commonplace then the eventual application is a cryopreservation system whereby cells, tissues, and organs are held indefinitely for use often in the unforeseen future. The increasing interest and capabilities for application could not have occurred at a more opportune time since expanding human populations have placed unprecedented pressures on plant diversity. This book emphasizes cryopreservation of higher plants and was initially driven by the concern for loss of diversity in crops and the recognized need that this diversity would be essential for continued improvement of the many plants used by society for food, health, and shelter. The interest in cryopreservation has been expanded by conservationists and their concerns for retaining as much as possible the diversity of natural populations. The need for cryopreservation thus is well established.
