

Upper Atmosphere

The Earth's atmosphere has four primary layers: the troposphere, stratosphere, mesosphere, and thermosphere. These layers protect our planet by absorbing harmful radiation.

Aeronomy of Ice in the Mesosphere (AIM)

AIM's primary focus is the Mesosphere (M) which has recently come right to hand thanks to the mesosphere. These nocturnal clouds are made of ice crystals that form over the summer pole at an altitude of 80 km and a temperature too cold for water vapor clouds.

Thermosphere

In the Thermosphere, molecules of oxygen and nitrogen are ionized by solar radiation. This ionization produces free electrons and positively charged ions that form the ionosphere. The thermosphere extends to temperatures with altitude because the atomic oxygen and nitrogen cannot radiate away heat from this absorption.

Mesosphere

During the mesosphere, it is possible to see nocturnal light ray clouds in the Earth's atmosphere and they have changed their density. There the mesosphere is responsible for most changes in atmospheric density and composition. It could provide them to clouds, and it has other phenomena such as meteor trails and auroras. It is a change in temperature that is most responsible for the atmosphere.

Stratosphere

The lower layer has within the stratosphere and clouds observed within this layer.

Troposphere

The troposphere is the layer of the Earth's atmosphere where all human activity takes place.

Auroras

The aurora is a layer of plasma formed by the ionization of atomic oxygen and nitrogen by highly energetic electrons and ions that is visible. The aurora extends from the bottom of the atmosphere up to the ionosphere. This layer varies daily on the surface compared to solar radiation causes the ionization of the atoms but can extend down as far as the ionosphere. However, from upper atmospheric layers are still mostly neutral, with only one in a million particles becoming charged daily. At night, the aurora usually collapses in the dark and is not visible with the stars in the Thermosphere. There are still small amounts of charged atoms caused by cosmic radiation.

Balloons, Balloons, and Satellites

AIM scientists use balloons to collect locally measurements in the atmosphere. However, the mesosphere and thermosphere are too high for balloons to reach, so scientists use instruments on sounding balloons and satellites to gather more detailed measurements of the upper atmosphere.

Communication

A unique property of the ionosphere is that it can reflect short-wave radio waves, enabling communication over great distances by "bouncing" signals off the actual atmosphere layer. Variability of the ionosphere can interrupt satellite communication, such as errors in GPS signals for commercial air navigation. During solar storms, this layer can even shut down communication between ground stations and satellites.

Nocturnal Clouds in the Mesosphere

Evidence of changes in the behavior of nocturnal clouds has been observed by the AIM mission. Recent data show dramatically less in ice content, leading scientists to speculate about changes in weather conditions and pole-to-pole atmospheric circulation.

BARREL

The Ballot Army for Radiation-Induced Reliability Electric Losses (BARREL) is a balloon-based mission to expand the measurements of NASA's SPO experiment. BARREL seeks to measure the propagation of relativistic electrons from the ionosphere belts during two multi-balloon campaigns operated in the Southern Hemisphere.
