Content and Goals of the Course

We will **classify soft matter** with focus on **polymer** materials. Here, we will discuss the influence of the **macromolecular architecture**, the chosen **processing** route and processing conditions, on the resulting materials **properties**. In this context, we will discuss the importance of **morphology**, which is the organization of materials at any length scale. **Morphology is the central link between “structure” and “properties” of soft matter.** Our basic understanding of structure-property relations will be reinforced by introducing **examples** from various application areas, e.g. organic electronics, food and biomedical, followed by case studies and discussion.

The student should attain

- 1) Ability to link macromolecular architecture, processing routes and properties of soft matter;
- 2) Insights on the importance of morphology for the performance of soft matter products; and
- 3) Basic understanding on routes for tuning morphology to achieve desired properties.

Structure Property Relations:

Structure-property relations Robert E. Newnham, 1975 Structure—Property Relationships in Polymers Charles E. Carraher Jr., R.B. Seymour, 2012-12-06 The first concern of scientists who are interested in synthetic polymers has always been and still is How are they synthesized But right after this comes the question What have I made and for what is it good This leads to the important topic of the structure property relations to which this book is devoted Polymers are very large and very complicated systems their characterization has to begin with the chemical composition configuration and conformation of the individual molecule The first chapter is devoted to this broad objective The immediate physical consequences discussed in the second chapter form the basis for the physical nature of polymers the supermolecular interactions and arrangements of the individual macromolecules The third chapter deals with the important question How are these chemical and physical structures experimentally determined The existing methods for polymer characterization are enumerated and discussed in this chapter The following chapters go into more detail For most applications textiles films molded or extruded objects of all kinds the mechanical and the thermal behaviors of polymers are of preponderant importance followed by optical and electric properties Chapters 4 through 9 describe how such properties are rooted in and dependent on the chemical structure More detailed considerations are given to certain particularly important and critical properties such as the solubility and permeability of polymeric systems Macromolecules are not always the final goal of the chemist they may act as intermediates reactants or catalysts This topic is presented in Chapters 10 and 11 **Structure-property Relations for Model Epoxy Networks**, 1993 **Surface Layers** M. A. J. Somers, 1994 **Concepts of Matter in Science Education** Georgios Tsaparlis, Hannah Sevan, 2013-07-09 Bringing together a wide collection of ideas reviews analyses and new research on particulate and structural concepts of matter Concepts of Matter in Science Education informs practice from pre school through graduate school learning and teaching and aims to inspire progress in science education The expert contributors offer a range of reviews and critical analyses of related literature and in depth analysis of specific issues as well as new research Among the themes covered are learning progressions for teaching a particle model of matter the mental models of both students and teachers of the particulate nature of matter educational technology chemical reactions and chemical phenomena chemical structure and bonding quantum chemistry and the history and philosophy of science relating to the particulate nature of matter The book will benefit a wide audience including classroom practitioners and student teachers at every educational level teacher educators and researchers in science education If gaining the precise meaning in particulate terms of what is solid what is liquid and that air is a gas were that simple we would not be confronted with another book which while suggesting new approaches to teaching these topics confirms they are still very difficult for students to learn Peter Fensham Emeritus Professor Monash University Adjunct Professor QUT from the foreword to this book Multiple Representations in Chemical Education John K. Gilbert, David Treagust, 2009-02-28 Chemistry seeks to

provide qualitative and quantitative explanations for the observed behaviour of elements and their compounds. Doing so involves making use of three types of representation: the macro, the empirical properties of substances, the sub-micro, the natures of the entities giving rise to those properties, and the symbolic, the number of entities involved in any changes that take place. Although understanding this triplet relationship is a key aspect of chemical education, there is considerable evidence that students find great difficulty in achieving mastery of the ideas involved. In bringing together the work of leading chemistry educators who are researching the triplet relationship at the secondary and university levels, the book discusses the learning involved, the problems that students encounter, and successful approaches to teaching. Based on the reported research, the editors argue for a coherent model for understanding the triplet relationship in chemical education.

Polymorphism in Molecular Crystals Joel Bernstein, 2002. Polymorphism, the multiplicity of structures or forms, is a term that is used in many disciplines. In chemistry, it refers to the existence of more than one crystal structure for a particular chemical substance. The properties of a substance are determined by its composition and by its structure. In the last two decades, there has been a sharp rise in the interest in polymorphic systems as an intrinsically interesting phenomenon and as an increasingly important component in the development and marketing of a variety of materials based on organic molecules, e.g. pharmaceuticals, dyes, and pigments, explosives, etc. This book summarizes and brings up to date the current knowledge and understanding of polymorphism of molecular crystals and concentrates it in one comprehensive source. The book will be an invaluable reference for students, researchers, and professionals in the field.

Treatise on Process Metallurgy
Roderick Guthrie, Alexander McLean, Sridhar Seetharaman, H. Y. Sohn, 2024-01-25. *Treatise on Process Metallurgy*, Volume One: Process Fundamentals, provides academics with the fundamentals of the manufacturing of metallic materials from raw materials into finished parts or products. In these fully updated volumes, coverage is expanded into four volumes, including: Process Fundamentals (encompassing process fundamentals, structure and properties of matter, thermodynamic aspects of process metallurgy, and rate phenomena in process metallurgy); Processing Phenomena (encompassing interfacial phenomena in high temperature metallurgy, metallurgical process phenomena, and metallurgical process technology); Metallurgical Processes (encompassing mineral processing, aqueous processing, electrochemical material and energy processes, and iron and steel technology); and Non-ferrous Process Principles and Production Technologies (and more). The work distills the combined academic experience from the principal editor and the multidisciplinary four-member editorial board. Provides the entire breadth of process metallurgy in a single work. Includes in-depth knowledge in all key areas of process metallurgy. Approaches the topic from an interdisciplinary perspective, providing broad range coverage on topics.
