The Dork Effect:

Genetic techniques and circuit analysis William Wisden, Jochen C. Meier, How new genetic techniques are revolutionizing the study of neural circuits for both invertebrate and vertebrate systems Understanding how specific types of neurons contribute to behaviour is an ambitious goal For invertebrate model systems e.g worms flies neurons in the brain are often too small to be studied routinely by electrophysiological approaches For vertebrates large ensembles of cells have to be studied and these cells are often distributed over considerable volumes e.g GABAergic interneurons in neocortex Cell type selective manipulations may be a way forward for treating illness Before such aims can be realized or even appreciated as feasible the brain circuitry in experimental animals has to be known by both establishing the connections between cell types and reversibly manipulating the activity of the cells subtype selectively Methods that have all appeared in just the last couple of years to tackle this include retrograde tracing of circuitry using viruses ligand receptor combinations that make subtypes of neurons uniquely sensitive to a drug e.g zolpidem allatostatin serotonin ligands or ivermectin and light activated channels and pumps for stimulation and inhibition This collection of methods promises much forming the new subdisciplines of pharmacogenetics and optogenetics These methods are revolutionizing the study of brain circuitry for both invertebrates and vertebrate systems

Diminished Faculties Jonathan Sterne, 2021-10-25 In *Diminished Faculties* Jonathan Sterne offers a sweeping cultural study and theorization of impairment Drawing on his personal history with thyroid cancer and a paralyzed vocal cord Sterne undertakes a political phenomenology of impairment in which experience is understood from the standpoint of a subject that is not fully able to account for itself He conceives of impairment as a fundamental dimension of human experience examining it as both political and physical While some impairments are enshrined as normal in international standards others are treated as causes or effects of illness or disability Alongside his fractured account of experience Sterne provides a tour of alternative vocal technologies and practices a study of normal hearing loss as a cultural practice rather than a medical problem and an intertwined history and phenomenology of fatigue that follows the concept as it careens from people to materials science to industrial management to spoons Sterne demonstrates how impairment is a problem opportunity and occasion for approaching larger questions about disability subjectivity power technology and experience in new ways *Diminished Faculties* ends with a practical user's guide to impairment theory

Advanced Brain Neuroimaging Topics in Health and Disease Dorina Papageorgiou, George Christopoulos, Stelios Smirnakis, 2014-05-31 The brain is the most complex computational device we know consisting of highly interacting and redundant networks of areas supporting specific brain functions The rules by which these areas organize themselves to perform specific computations have only now started to be uncovered Advances in non invasive neuroimaging technologies have revolutionized our understanding of the functional anatomy of cortical circuits in health and disease states which is the focus of this book The first section of this book focuses on methodological issues such as combining functional MRI technology with

other brain imaging modalities The second section examines the application of brain neuroimaging to understand cognitive visual auditory motor and decision making networks as well as neurological diseases The use of non invasive neuroimaging technologies will continue to stimulate an exponential growth in understanding basic brain processes largely as a result of sustained advances in neuroimaging methods and applications
