major feasibility demonstrations were done by using a digital com puter with A D equipment However an analog extremal coding system was built in order to demonstrate the equipment simplicity The work here showed that asynchronous time multiplexing is feasible under the conditions treated for systems having as few as 24 sources It ss concluded that the advantage of this method over synchronously multipl xed PCM is about 2 7 for 100 sources and 2 1 and 24 sources Increases in this advantage should be possible with system improvements The speech quality with this advantage is not distinguishable with casual listening from that of the usual PCM Author
