Continuous-Time Systems Yuriy Shmaliy, 2007-09-23 Continuous Time Systems is a description of linear nonlinear time invariant and time varying electronic continuous time systems As an assemblage of physical or mathematical components organized and interacting to convert an input signal also called excitation signal or driving force to an output signal also called response signal an electronic system can be described using different methods offered by the modern systems theory To make possible for readers to understand systems the book systematically covers major foundations of the systems theory First the quantitative and qualitative methods of systems description are presented along with the stability analysis The representation of linear time invariant systems in the time domain is provided using the convolution ordinary differential equations ODEs and state space In the frequency domain these systems are analyzed using the Fourier and Laplace transforms The linear time varying systems are represented using the general convolution ODEs and state space The nonlinear time invariant systems are described employing the Taylor and Volterra series expansions ODEs state space and approximate methods such as averaging equivalent linearization and describing function Finally the representation of nonlinear time varying systems is given using the Taylor and Volterra series ODEs modulation functions method and state space modelling Review of matrix theory and other useful generalizations are postponed to Appendices
