Solarspots

Solarspots are concentrated areas of dark magnetic flux that inhibit the release of energy from the solar atmosphere. Periods with no spots last on the order of weeks. A few complete solar cycles, which are approximately the length of a year, are observed.

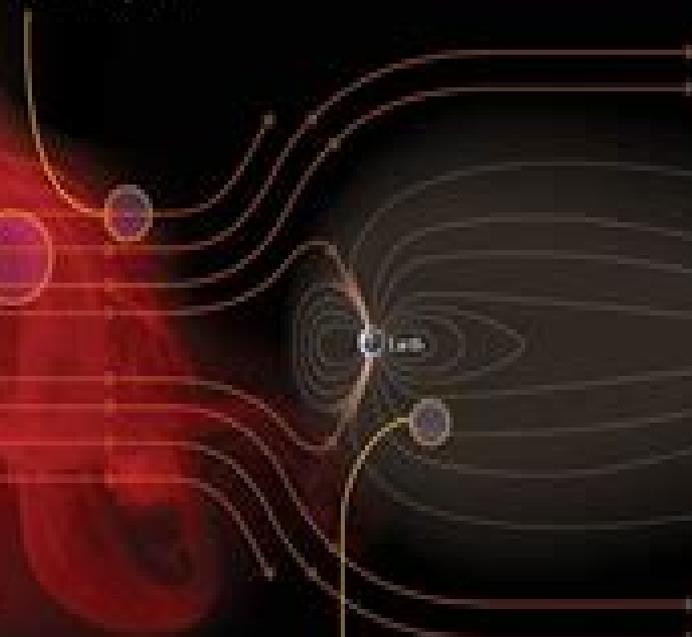

Coronal Mass Ejections (CMEs)

Large portions of the corona, or outer atmosphere of the Sun, can be explosively blown into space, sending billions of tons of plasma, or ionized gas, Earth's direction. These CMEs have their own magnetic field and can slow and interact with Earth's magnetic field, resulting in geomagnetic storms. The fastest of these CMEs can reach Earth in under a day, with the slowest taking 1 or 2 days to reach Earth.

Solar Wind

The solar wind is a constant outflow of the ions and electrons from the Sun, always present and including Earth in its magnetic field. The background solar wind flows at approximately one million miles per hour.

Sun's Magnetic Field

Strong and ever-changing magnetic fields drive the life of the Sun and enable sunspots. These strong magnetic fields are the energy source for space weather and flare heating, the solar wind, and coronation holes that lead to solar flares.

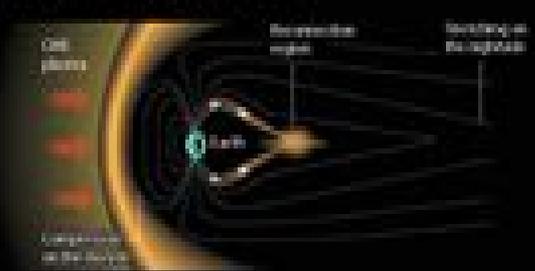

Solar Radiation Storms

Charged particles, including electrons and protons, can be accelerated by coronal mass ejections and solar flares. These particles become and speed their way through space months following the magnetic field lines and ultimately bombard Earth from every direction. The fastest of these particles can affect Earth less than an hour after a solar flare.

Geomagnetic Storms

A geomagnetic storm is a temporary disturbance of Earth's magnetic field typically associated with solar activity in the solar wind. These storms are caused when the solar wind and its magnetic field interacts with Earth's magnetic field. The primary cause of geomagnetic storms is CMEs which stretch the magnetosphere on the nightside causing it to release energy through magnetic reconnection. Disturbances in the ionosphere (region of Earth's upper atmosphere) are usually associated with geomagnetic storms.

Solar Flares

Reconnection of the magnetic field on the surface of the Sun drives the biggest explosions in our solar system. These solar flares release immense amounts of energy and result in electromagnetic emissions spanning the spectrum from gamma-ray to radio waves. Traveling at the speed of light, these emissions make the 93 million mile trip to Earth in just minutes.

Earth's Magnetic Field

Earth's magnetic field largely shields the Earth from particles from the effects of the Sun. Earth's magnetic field is constantly compressed on the day side and stretched on the night side by the ever present solar wind. During geomagnetic storms, the disturbance in Earth's magnetic field can become extreme. In addition to solar heating by the atmosphere, the field also often causes disturbances from the charged particles of radiation storms.
