Maintenance - A Management Perspective Phaneendra Nath Vellanky,2007-10-23 Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact **Neutrosophic fuzzy goal programming approach in selective maintenance allocation of system reliability** Murshid Kamal,Umar Muhammad Modibbo,Ali AlArjani,Irfan Ali, Selective maintenance problem plays an

essential role in reliability optimization decision making problems Systems are a configuration of several components and there are situations the system needs small intervals or break for maintenance actions during the intervals expert carried out the maintenance actions to replace or repair the deteriorated components of the systems Because of the uncertainty associated with the component s operational time failure and next mission duration create a new challenge in determining optimal components allocation and evaluating future missions successfully In this paper a multi objective selective maintenance allocation problem is formulated with fuzzy parameters under neutrosophic environment A new defuzzification technique is introduced based on beta distribution to convert fuzzy parameters into crisp values The neutrosophic goal programming technique is used to determine the compromise allocation of replaceable and repairable components based on the system reliability optimization A numerical illustration is used to validate the model and ascertain its effectiveness The result is compared with two other approaches and found to be better The method is flexible and straightforward and can be solved using any available commercial packages The extension of the concept can be useful to other complex system reliability optimization
