Analysis:

In free design, higher building heights have been achieved due to presence of higher FSI, while in constraint due to less FSI low lying buildings have been formed in the market area. This is also due to smaller plot sizes in Free design.

Open spaces are formed better in constraint design providing accessibility to assembly and acting as a buffer space at the same time. Green street connectivity in free design provides better walkability and functionality in pedestrian.

In Constraint design, due to large margins and setbacks, and large layout spaces in the plots as per the regulator, it is difficult to acquire the required ground coverage as per the regulations, resulting in low density.
