Stochastic Point Processes and Their Applications S. Kidambi Srinivasan,1974 **Point Processes and Product Densities** S. Kidambi Srinivasan,A. Vijayakumar,2003 Point processes are random processes that are concerned with point events occurring in space or time A powerful method of analyzing them is through a sequence of correlation functions called product densities introduced by Alladi Ramakrishnan In view of their wide applicability there is a spectacular development of the theory and applications of these processes in the recent past Most of the books and monographs in this area are not easily comprehensible to non mathematically oriented readers because of their abstraction and generality In addition the best way to learn a subject is to study the original papers Hence it is considered worthwhile to reprint some of the most significant contributions of Alladi Ramakrishnan and his associates to serve as a ready reference volume While a good working knowledge of elementary probability theory is a must some acquaintance with Markov processes will be helpful to read these papers This volume will be useful to young researchers working in the broad area of stochastic point processes and their applications and in particular indispensable to those working in stochastic modeling with special reference to problems of queues inventory reliability neural network etc It will also be useful to those working in the conventional areas of statistical physics fluctuating phenomena and communication theory and control where point processes are extensively employed Stochastic Point Processes: Statistical Analysis, Theory, and Applications Peter A. W. Lewis,1972 Point Processes for Reliability Analysis Ji Hwan Cha,Maxim Finkelstein,2018-01-17 Focusing on the theory and applications of point processes Point Processes for Reliability Analysis naturally combines classical results on the basic and advanced properties of point processes with recent theoretical findings of the authors It also presents numerous examples that illustrate how general results and approaches are applied to stochastic description of repairable systems and systems operating in a random environment modelled by shock processes The real life objects are operating in a changing random environment One of the ways to model an impact of this environment is via the external shocks occurring in accordance with some stochastic point processes The Poisson homogeneous and nonhomogeneous process the renewal process and their generalizations are considered as models for external shocks affecting an operating system At the same time these processes model the consecutive failure repair times of repairable engineering systems Perfect minimal and intermediate imperfect repairs are discussed in this respect Covering material previously available only in the journal literature Point Processes for Reliability Analysis provides a survey of recent developments in this area which will be invaluable to researchers and advanced students in reliability engineering and applied mathematics Point Process Calculus in Time and Space Pierre Brémaud,2020-12-05 This book provides an introduction to the theory and applications of point processes both in time and in space Presenting the two components of point process calculus the martingale calculus and the Palm calculus it aims to develop the computational skills needed for the study of stochastic models involving point processes providing enough of the

general theory for the reader to reach a technical level sufficient for most applications Classical and not so classical models are examined in detail including Poisson Cox renewal cluster and branching Kerstan Hawkes point processes The applications covered in this text queueing information theory stochastic geometry and signal analysis have been chosen not only for their intrinsic interest but also because they illustrate the theory Written in a rigorous but not overly abstract style the book will be accessible to earnest beginners with a basic training in probability but will also interest upper graduate students and experienced researchers *The Impact of Processing Techniques on Communications* J.K.

Skwirzynski,2012-12-06 This volume contains the full proceedings of the Fourth Advanced Study Institute organised by myself and my colleagues in the field of Communication Theory and Allied Subjects In the first Institute we associated the subject of signal processing in communication with that in control engineering Then we concentrated on noise and random phenomena by bringing in as well the subject of stochastic calculus The third time our subject was multi user communication and associated with it the important problem of assessing algorithmic complexity This time we are concerned with the vast increase of computational power that is now available in communication systems processors and controllers This forces a mathematical algorithmic and structural approach to the solution of computational requirements and design problems in contrast to previous heuristic and intuitive methods We are also concerned with the interactions and trade offs between the structure speed and complexity of a process and between software and hardware implementations At the previous Advanced Study Institute in this series on Multi User Communications there was a session on computational complexity applied particularly to network routing problems It was the aim of this Institute to expand this topic and to link it with information theory random processes pattern analysis and implementation aspects of communication processors The first part of these proceedings concentrates on pattern and structure in communications processing In organising this session I was greatly helped and guided by Professor P G Farrell and Professor J L Massey **Point Process Theory and Applications** Martin

Trading and Modeling in Finance Ionut Florescu,Maria Cristina Mariani,H. Eugene Stanley,Frederi G. Viens,2016-04-05 Reflecting the fast pace and ever evolving nature of the financial industry the Handbook of High Frequency Trading and Modeling in Finance details how high frequency analysis presents new systematic approaches to implementing quantitative activities with high frequency financial data Introducing new and established mathematical foundations necessary to analyze realistic market models and scenarios the handbook begins with a presentation of the dynamics and complexity of futures and derivatives markets as well as a portfolio optimization problem using quantum computers Subsequently the handbook

addresses estimating complex model parameters using high frequency data Finally the handbook focuses on the links between models used in financial markets and models used in other research areas such as geophysics fossil records and earthquake studies The Handbook of High Frequency Trading and Modeling in Finance also features Contributions by well known experts within the academic industrial and regulatory fields A well structured outline on the various data analysis methodologies used to identify new trading opportunities Newly emerging quantitative tools that address growing concerns relating to high frequency data such as stochastic volatility and volatility tracking stochastic jump processes for limit order books and broader market indicators and options markets Practical applications using real world data to help readers better understand the presented material The Handbook of High Frequency Trading and Modeling in Finance is an excellent reference for professionals in the fields of business applied statistics econometrics and financial engineering The handbook is also a good supplement for graduate and MBA level courses on quantitative finance volatility and financial econometrics

On Superposition of Stochastic Point Processes and Their Application to Computer System Modelling A. Agrawala, J. Mohr, 1975 *Developments in Statistics* Paruchuri R. Krishnaiah, 2014-06-28 Development in Statistics Volume 1 is a collection of papers that deals with theory and application of parameter estimation in stochastic differential systems the comparative aspects of the study of ordinary time series and real multivariate distributions Some papers discuss covariance analysis of nonstationary time series nonparametric repeated significance tests as well as discrete optimal factorial designs

for statisticians and investigators of experiments One paper cites an application of parameter estimation in stochastic differential systems in approximates of stability and control derivatives from flight test data Another paper cites cases where procedures of ordinary time series or point processes have direct analogs in the study of point processes or ordinary time series One paper explains the applications of multivariate distributions in simultaneous tests on the equality of eigenvalues toward the covariance matrix canonical correlation matrix and a matrix associated with the multivariate analysis of variance Another paper reviews two types of repeated significance tests namely the genuinely distribution free tests based on a broad class of nonparametric statistics and the asymptotically distribution free tests based on a broad class of parametric statistics but having asymptotically nonparametric behavior Both types can provide a unified solution to a broad class of problems The collection can be valuable for mathematicians students and professors of calculus statistics or advanced mathematics

Poisson Point Processes and Their Application to Markov Processes Kiyosi Itô, 2015-12-24 An extension problem often called a boundary problem of Markov processes has been studied particularly in the case of one dimensional diffusion processes by W Feller K It and H P McKean among others In this book It discussed a case of a general Markov process with state space S and a specified point $a \in S$ called a boundary The problem is to obtain all possible recurrent extensions of a given minimal process $i.e.$ the process on S which is absorbed on reaching the boundary a The study in this lecture is restricted to a simpler case of the boundary a being a discontinuous entrance point leaving a more general case of a continuous entrance point to future works He established a one to one correspondence between a recurrent extension and a pair of a positive measure ν on S called the jumping in measure and a non negative number m *Modeling in the Neurosciences* G. Kagan,2013-12-18 This book is the first comprehensive and methodologically rigorous analysis of earthquake occurrence Models based on the theory of the stochastic multidimensional point processes are employed to approximate the earthquake occurrence pattern and evaluate its parameters The Author shows that most of these parameters have universal values These results help explain the classical earthquake distributions Omori s law and the Gutenberg Richter relation The Author derives a new negative binomial distribution for earthquake numbers instead of the Poisson distribution and then determines a fractal correlation dimension for spatial distributions of earthquake hypocenters The book also investigates the disorientation of earthquake focal mechanisms and shows that it follows the rotational Cauchy distribution These statistical and mathematical advances make it possible to produce quantitative forecasts of earthquake occurrence In these forecasts earthquake rate in time space and focal mechanism orientation is evaluated **Analisi funzionale e applicazioni** ,1980 *The Mathematical Gazette* ,1989
