

STOCHASTIC ENCODERS

Above is the structure of the variational auto-encoder (VAE). The stochastic encoder $q_\phi(z|x)$, also called the inference model, learns stochastic mappings between an observed X -space (input data) and a latent Z -space (hidden representation). The generative model $p_\theta(x|z)$, a stochastic decoder, reconstructs the data given the hidden representation.

Sergio Fajardo, H. Jerome Keisler, 2017-03-30 Since their inception the Perspectives in Logic and Lecture Notes in Logic series have published seminal works by leading logicians Many of the original books in the series have been unavailable for years but they are now in print once again In this volume the fourteenth publication in the Lecture Notes in Logic series Fajardo and Keisler present new research combining probability theory and mathematical logic It is a general study of stochastic processes using ideas from model theory a key central theme being the question When are two stochastic processes alike The authors assume some background in nonstandard analysis but prior knowledge of model theory and advanced logic is not necessary This volume will appeal to mathematicians willing to explore new developments with an open mind
