## **The Earth's Climate Past And Future:**

**Earth's Climate** William F. Ruddiman, 2008 Earth's Climate summarises the major lessons to be learned from 550 million years of climate changes as a way of evaluating the climatological impact on and by humans in this century. The book also looks ahead to possible effects during the next several centuries of fossil fuel use. [Loose-leaf Version for Earth's Climate](#) William F. Ruddiman, 2013-10-01 At a time when the evidence is stronger than ever that human activity is the primary cause for global climate change, William Ruddiman's breakthrough text returns in a thoroughly updated new edition. It offers a clear, engaging, objective portrait of the current state of climate science, including compelling recent findings on anthropogenic global warming and important advances in understanding past climates. **Earth's Climate** William F. **Understanding Earth's Deep Past** National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on the Importance of Deep-Time Geologic Records for Understanding Climate Change Impacts, 2011-08-02 There is little dispute within the scientific community that humans are changing Earth's climate on a decadal to century time scale. By the end of this century, without a reduction in emissions, atmospheric CO<sub>2</sub> is projected to increase to levels that Earth has not experienced for more than 30 million years. As greenhouse gas emissions propel Earth toward a warmer climate state, an improved understanding of climate dynamics in warm environments is needed to inform public policy decisions. In *Understanding Earth's Deep Past*, the National Research Council reports that rocks and sediments that are millions of years old hold clues to how the Earth's future climate would respond in an environment with high levels of atmospheric greenhouse gases. *Understanding Earth's Deep Past* provides an assessment of both the demonstrated and underdeveloped potential of the deep-time geologic record to inform us about the dynamics of the global climate system. The report describes past climate changes and discusses potential impacts of high levels of atmospheric greenhouse gases on regional climates, water resources, marine and terrestrial ecosystems, and the cycling of life-sustaining elements. While revealing gaps in scientific knowledge of past climate states, the report highlights a range of high-priority research issues with potential for major advances in the scientific understanding of climate processes. This proposed integrated deep-time climate research program would study how climate responded over Earth's different climate states, examine how climate responds to increased atmospheric carbon dioxide and other greenhouse gases, and clarify the processes that lead to anomalously warm polar and tropical regions and the impact on marine and terrestrial life. In addition to outlining a research

agenda Understanding Earth's Deep Past proposes an implementation strategy that will be an invaluable resource to decision makers in the field as well as the research community advocacy organizations government agencies and college professors and students

It's a question that has engaged climate scientists for more than a decade Not if human activity impacts the environment but when did that impact start to be significant Was it in the mid 18th century as long believed with the Industrial Revolution producing huge amounts in greenhouse gas emissions Or did it actually begin thousands of years earlier as a result of the discovery and spread of agricultural practices

Should We Fertilize the Oceans? Andrea Catherine Ryan, 1998

John Martin's iron hypothesis Martin 1990 and the subsequent ground breaking IRONEX experiments Martin 1994 Coale 1996 have stimulated wide spread speculation about the concept of fertilizing the oceans It has been suggested that adding nutrients to the open oceans will stimulate primary production increasing the sequestration of carbon dioxide and enhancing potential fish harvest Ocean fertilization has thus been heralded as a possible cure for global climate change and world food shortages Despite considerable scientific effort private investment and public interest in this field there has been limited evaluation of the feasibility of ocean fertilization This thesis attempts to fill this void by addressing not only the scientific but also the economic and policy dimensions of ocean fertilization It starts by reviewing current research proposals and implementation activities in the field of ocean fertilization It identifies potential environmental impacts and biogeochemical consequences of ocean fertilization highlighting the outstanding scientific unknowns associated with this field The study reviews cost estimates compiled by the private sector and examines likely practical obstacles to implementation Legal political and public response to fertilization proposals is also explored Finally some of the ethical concerns relating to fertilizing the oceans are discussed and recommendations on future research directions and initiatives to manage this rapidly growing field are provided
