Smart Energy Practices for a Sustainable World Nina S. Godbole, John P. Lamb, 2023-06-13 Mankind has scaled unprecedented growth since the advent of the Industrial Revolution. However, this progress has come at the hefty cost of environmental degradation. Climate change undeniably is one of the biggest challenges of the planet Earth and is largely anthropogenic. In the modern world context, the phenomenon of climate change is one of the most defining issues when it comes to realizing objectives of the Sustainable Development Goals (SDGs). Climate change is not limited to geographical boundaries; it is a global problem hence requires global solutions. It has been widely discussed and therefore has acquired centre stage across the major world forums. *Smart Energy Practices for a Sustainable World* how we all can contribute stresses the need for us to judiciously, sustainably and smartly harness and use energy techniques in order to effectively combat climate change. The book also gives an in-depth discussion on utilization of artificial intelligence and information technology to realize energy efficiency in various sectors of economy including but not limited to transportation, buildings, infrastructure, health care and other services. Text is supplemented by case studies that depict ground level reality to facilitate comprehension of the subject matter. The appendices serve as an extended learning of the concepts discussed in the chapters. The publication would serve as a valuable reference for both scholars and researchers engaged in the domain in addition to being a guide to industry as well as the academic world.

Energy, and Sustainable Production, 3rd edition Umer Shahzad, Gagan Deep Sharma, Lianbiao Cui, John Mendy, 2025-11-20

Economic development has long been acknowledged for its beneficial effects on human well-being. In the context of economic globalization and vertical specialization, increasing the quality of export products is more critical and necessary to export success and sustainable development. The product's quality is inextricably linked to its manufacture and production, which need various types of energy and raw materials. Meanwhile, the adoption of more environmentally friendly and cleaner energy sources contributes to the achievement of sustainable production. Therefore, product quality may provide a new perspective from which to investigate the systematic relationship between greener and renewable energy sources, sustainable production, and environmental regulations, as well as the nature of export competitiveness. Generally, export product quality has referred to the quality of manufactured products within the product lines. Quality refers to the relative price of a country's varieties within their respective product lines. Product sophistication assesses the composition of the aggregate exports. Different varieties of the same product at different quality levels are being produced by several developing and emerging economies. Within any given product line, quality converges both conditionally and unconditionally to the world's benchmark. Increases in institutional quality and human capital are associated with faster quality upgrading. In turn, faster growth in quality is associated with more rapid output growth. The existing literature has mostly concentrated on the question of whether environmental regulation enhances or erodes export competitiveness, offering some valuable insights into Porter's theory, but it lacks a coherent theoretical framework. Little research has been done to examine the relationship between export product quality and renewable energy sources, manufacturing, and overall sustainable production, calling for advancement of the scholarship to tackle this burning issue. Numerous concerns have been expressed over the appalling connection between sustained development, industry, and environmental protection. The United Nations (UN) adopted the 2030 Agenda for Sustainable Development in 2015 to balance economic, social, and environmental development through the introduction of 17 Sustainable Development Goals (SDGs), which encouraged researchers in trade, environment, energy, and related fields to adopt an integrative rather than isolative approach. This Research Topic is dedicated to the study of the environment through the lenses of export product quality, export policies, and sustainable production. The aim is to advance knowledge in the fields of export quality, trade perspectives, renewable energy, the environment, and sustainable production through the dissemination of research that promotes holistic sustainability for the greater welfare of humanity. This topic will prioritize research focusing on emerging and developing economies. Academic scholars and researchers must both test hypotheses and put forward ideas for new solutions. For example, it is assumed that higher quality products require expensive inputs and resources for manufacturing. It must also provide strategies for a speedy and economically viable transition to renewable energy. This Research Topic is a step in this direction.
