Tree Islands Of The Everglades:

Tree Islands of the Everglades Fred H. Sklar, Arnold van der Valk, 2012-12-06 PREFACE Within the Florida Everglades tree islands which cover only a small percent of this ecosystem historically have provided essential habitat for a wide variety of terrestrial and amphibious plants birds and animals These tree islands however have been one of its least studied features Because of their less flood tolerant vegetation tree islands are one of the most sensitive components of the Everglades to changes in hydrology and many tree islands have been lost during periods when water levels have been abnormally high or low Their sensitivity to water level changes makes tree islands potentially one of the best and surest measures of the overall hydrologic health of the Everglades Consequently the maintenance of healthy functioning tree islands and the restoration of those that have been lost will be an important performance measure that will be used to judge the success of the Comprehensive Everglades Restoration Plan CERP A symposium Tree Islands of the Everglades was held on July 14 and 15 1998 at Florida Atlantic University Boca Raton Florida It was sponsored by Florida Center for Environmental Studies and the South Florida Water Management District This was the first scientific meeting ever devoted to tree islands The organizers of this symposium were Drs Arnold van der Valk Florida Center for Environmental Studies and Iowa State University Fred Sklar South Florida Water Management District and Wiley Kitchens United States Geological Survey **Tree Islands of the Florida Everglades** Debra Ann Willard, 2004 **Tree Islands of the Florida Everglades** Geological Survey (U.S.), 2003

Wildlife Occurrence on Tree Islands in the Everglades in Relation to Water Levels Jennifer Kay Ketterlin Eckles, 2013 Tree islands in the Florida Everglades provide important habitat for wildlife especially terrestrial mammals More information about the relationship between wildlife use of tree islands and spatial and temporal variables is needed to better manage these resources as part of Everglades restoration This study employed camera trapping to determine effects of changing marsh water levels tree island size temperature and rainfall on small and medium sized mammals in the Everglades Camera height was also tested for its effect on detection of each species Camera traps were deployed on 68 tree islands over the course of almost 11 months Tree island use by *Odocoileus virginianus* White tailed Deer was positively affected by higher water levels but detection was not affected by camera height Use by *Sylvilagus palustris* Marsh Rabbit was also positively affected by water levels and they were detected more often when camera height was lower *Lynx rufus* Florida Bobcat use of tree islands may be correlated with lower average daily temperatures but total rainfall and camera height do not seem to have an effect Use of tree islands by *Procyon lotor* Northern Raccoon and *Oryzomys palustris* Marsh Rice Rat was not related to any of the variables tested When all species were combined higher water levels and lower camera height resulted in more use and detection of wildlife on tree islands respectively This information can be used to inform biologists on managing wildlife populations that will be affected by Everglades restoration **Florida Sinkholes** Robert Brinkmann, 2013-10-29 Below the live oaks palm trees cypress swamps and springs water is slowly wearing away the limestone bedrock of Florida
