# Transact-SQL Reference (Transact-SQL)

Transact-SQL is central to using SQL Server. All applications that communicate with an instance of SQL Server do so by sending Transact-SQL statements to the server, regardless of the user interface of the application.

The following is a list of the kinds of applications that can generate Transact-SQL:

- General office productivity applications.
- Applications that use a graphical user interface (GUI) to let users select the tables and columns from which they want to see data.
- Applications that use general language sentences to determine what data a user wants to see.
- Lines of business applications that store their data in SQL Server databases. These applications can include both applications written by vendors and applications written in-house.
- Transact-SQL scripts that are run by using utilities such as sqlcmd.
- Applications created by using development systems such as Microsoft Visual C++, Microsoft Visual Basic, or Microsoft Visual J++ that use database APIs such as ADO, OLE DB, and ODBC.
- Web pages that extract data from SQL Server databases.
- Distributed database systems from which data from SQL Server is replicated to various databases, or distributed queries are executed.
- Data warehouses in which data is extracted from online transaction processing (OLTP) systems and processed for decision-support analysis.

To view the Transact-SQL reference topics:

To view the list of topics in the Transact-SQL reference section of SQL Server Books Online, follow these steps:

1. On the SQL Server Books Online toolbar, click the Sync with Table Of Contents button.
2. On the Contents tab, expand Transact-SQL Reference.
