## **Workflow Management Systems And Interoperability:**

Workflow Management Systems and Interoperability Asuman Dogac, Leonid Kalinichenko, Tamer Özsu, Amit Sheth, 2012-12-06 Workflow management systems WFMS are enjoying increasing popularity due to their ability to coordinate and streamline complex organizational processes within organizations of all sizes. Organizational processes are descriptions of an organization's activities engineered to fulfill its mission such as completing a business contract or satisfying a specific customer request. Gaining control of these processes allows an organization to reengineer and improve each process or adapt them to changing requirements. The goal of WFMSs is to manage these organizational processes and coordinate their execution. This was demonstrated in the first half of the 1990s by a significant increase in the number of commercial products, once estimated to be about 250, and the estimated market size in combined \$2 billion in 1996. Ensuing maturity, product sales and services of about \$1 billion is demonstrated by consolidations during the last year. Ranging from mere e-mail based calendar tools and flow charting tools to very sophisticated integrated development environments for distributed enterprise wide applications and systems to support programming in the large, these products are finding an eager market and opening up important research and development opportunities. In spite of their early success in the marketplace, however, the current generation of systems can benefit from further research and development especially for increasingly complex and mission critical applications.

Achieving Interoperability Between Workflow Management Systems Sarah D. Induruwa Fernando, 2010 *Integrative Document & Content Management* Len Asprey, Michael Middleton, 2003-01-01 Portals present unique strategic challenges in the academic environment. Their conceptualization and design requires the input of campus constituents who seldom interact and whose interests are often opposite. The implementation of a portal requires a coordination of applications and databases controlled by different campus units at a level that may never before have been attempted at the institution. Building a portal is as much about constructing intra-campus bridges as it is about user interfaces and content. *Designing Portals: Opportunities and Challenges* discusses the current status of portals in higher education by providing insight into the role portals play in an institution's business and educational strategy by taking the reader through the processes of conceptualization, design, and implementation of the portals in different stages of development at major universities and by offering insight from three producers of portal software systems in use at institutions of higher learning and elsewhere.

*Interorganizational Workflow Management* Karin Pargfrieder, 2002-05-30 *Inhaltsangabe Abstract* Conventional workflow management focuses on improving the efficiency of business processes within one organization. However, processes should not only be supported within the enterprise but also when crossing organizational boundaries, e.g. in order to support new forms of collaborations as virtual enterprises. Due to the different nature of interorganizational workflows, conventional workflow technology cannot be directly applied. The most important requirement specific to interorganizational workflow systems is obviously that they are able to deal with

heterogeneity and that it is not too expensive to achieve interoperability Also maintaining the privacy of internal processes is a major concern and security issues should be addressed This diploma thesis gives an introduction to conventional and interorganizational workflow management their aspects and concepts It elaborates the requirements relevant for interorganizational workflow systems describes the most important approaches projects and initiatives that currently exist in the area of interorganizational workflows including XML based approaches the standards of the WfMC electronic marketplaces and electronic contracting An evaluation of these approaches based on criteria derived from the requirements and other characteristics shows the differing strengths and weaknesses The XML based approaches provide standards for the process interfaces and can cope with heterogeneous environments very well Some of them even allow spontaneous commerce with new trading partners without custom integration Traditional EDI is in principle similar but has many disadvantages The standards of the WfMC enable integration with a very low effort if they are followed by software providers But privacy and security are potential problem areas and the models of interoperability that realistically can be supported are simple Electronic marketplaces and electronic contracting are ideal if a high number of business partners has to be supported and the services are chosen dynamically depending on the situation But these services have to be comparable with rather simple interfaces
