Solid State Fermentation Patrick Kimuyu, 2017-12-12 Research Paper postgraduate from the year 2016 in the subject Medicine Public Health grade 1 Egerton University language English abstract For centuries fermentation has been extensively applied in the production of distinct substances that remain highly beneficial to industries and people with its increasing techniques gaining immense significance due to their environmental and economic benefits According to recent studies solid state fermentation is considered as the cheapest and environmentally responsive approach for the production of value added industrial products for example enzymes biofuels and even nutrient enriched animal feeds Solid state fermentation may be described as the growth and or cultivation of micro organisms under controlled conditions without the presence of free liquid for desired products development It is an ancient technique that utilizes solid substrates such as bagasse paper pulp and bran A key benefit of using such substrates is that waste substances that are rich in nutrients can be recycled as substrates and due to the slow and steady substrate utilization the substrate may be used for long fermentation periods As a result this technique sustains controlled nutrients release Significantly solid state fermentation technique works best in techniques that involve fungi as well as micro organisms requiring less moisture content since the moisture required for the growth of microbes exists in absorbed states or in composite with solid matrix However even though this technique has diverse advantages especially compared with submerged fermentation technique there are certain processes in which SSF may not be used for example in bacterial fermentation or in processes that involve organisms requiring high water activity The main aim of this paper is thus describing solid state fermentation as a technique for the production of bioactive compounds **Innovative Food Processing Technologies** ,2020-08-18 Food process engineering a branch of both food science and chemical engineering has evolved over the years since its inception and still is a rapidly changing discipline While traditionally the main objective of food process engineering was preservation and stabilization the focus today has shifted to enhance health aspects flavour and taste nutrition sustainable production food security and also to ensure more diversity for the increasing demand of consumers The food industry is becoming increasingly competitive and dynamic and strives to develop high quality freshly prepared food products To achieve this objective food manufacturers are today presented with a growing array of new technologies that have the potential to improve or replace conventional processing technologies to deliver higher quality and better consumer targeted food products which meet many if not all of the demands of the modern consumer These new or innovative technologies are in various stages of development including some still at the R D stage and others that have been commercialised as alternatives to conventional processing technologies Food process engineering comprises a series of unit operations traditionally applied in the food industry One major component of these operations relates to the application of heat directly or indirectly to provide foods free from pathogenic microorganisms but also to enhance or intensify other processes such as extraction separation or modification of components The last three

decades have also witnessed the advent and adaptation of several operations processes and techniques aimed at producing high quality foods with minimum alteration of sensory and nutritive properties Some of these innovative technologies have significantly reduced the thermal component in food processing offering alternative nonthermal methods Food Processing Technologies A Comprehensive Review Three Volume Set covers the latest advances in innovative and nonthermal processing such as high pressure pulsed electric fields radiofrequency high intensity pulsed light ultrasound irradiation and new hurdle technology Each section will have an introductory article covering the basic principles and applications of each technology and in depth articles covering the currently available equipment and or the current state of development food quality and safety application to various sectors food laws and regulations consumer acceptance advancements and future scope It will also contain case studies and examples to illustrate state of the art applications Each section will serve as an excellent reference to food industry professionals involved in the processing of a wide range of food categories e g meat seafood beverage dairy eggs fruits and vegetable products spices herbs among others
