technology Provides in depth discussion of oat milling and oat fractionation Demystifies oat phenolics Provides a peer reviewed in depth discussion of oat phenolic chemistry and functional attributes Process-Induced Chemical Changes in Food Fereidoon Shahidi, Chi-Tang Ho, Nguyen Van Chuyen, 1998-04-30 Chemical changes that occur in foods during processing and storage are manifold and might be both desirable and undesirable in nature While many of the processes are carried out intentionally there are also certain unwanted changes that naturally occur in food and might have to be controlled Therefore efforts are made to devise processing technologies in which desirable attributes of foods are retained and their deleterious effects are minimized While proteins lipids and carbohydrates are the main nutrients of food that are affected by processing it is their interaction with one another as well as involvement of low molecular weight constituents that affects their flavor color and overall acceptability Thus generation of aroma via thermal processing and bioconversion is of utmost importance in food preparation Furthermore processing operations must be optimized in order to eliminate or reduce the content of antinutrients that are present in foods and retain their bioactive components Therefore while novel processing technologies such as freezing irradiation microwaving high pressure treatment and fermentation might be employed control process conditions in a manner that both the desirable sensory attributes and wholesomeness of foods are safeguarded is essential Obviously methodologies should also be established to quantify the changes that occur in foods as a result of processing This volume was developed from contributions provided by a group of internationally recognized lead scientists
