Numerical Solution of Partial Differential Equations in Science and Engineering Leon Lapidus, George F. Pinder, 1982 This book was written to provide a text for graduate and undergraduate students who took our courses in numerical methods It incorporates the essential elements of all the numerical methods currently used extensively in the solution of partial differential equations encountered regularly in science and engineering Because our courses were typically populated by students from varied backgrounds and with diverse interests we attempted to eliminate jargon or nomenclature that would render the work unintelligible to any student Moreover in response to student needs we incorporated not only classical and not so classical finite difference methods but also finite element collocation and boundary element procedures After an introduction to the various numerical schemes each equation type parabolic elliptic and hyperbolic is allocated a separate chapter Within each of these chapters the material is presented by numerical method Thus one can read the book either by equation type or numerical approach Preface page v **Partial Differential Equations** N.D. Bellman, G. Adomian, 2012-12-06 The purpose of this book is to present some new methods in the treatment of partial differential equations Some of these methods lead to effective numerical algorithms when combined with the digital computer Also presented is a useful chapter on Green s functions which generalizes after an introduction to new methods of obtaining

Green's functions for partial differential operators Finally some very new material is presented on solving partial differential equations by Adomian's decomposition methodology This method can yield realistic computable solutions for linear or nonlinear cases even for strong nonlinearities and also for deterministic or stochastic cases again even if strong stochasticity is involved Some interesting examples are discussed here and are to be followed by a book dealing with frontier applications in physics and engineering In Chapter I it is shown that a use of positive operators can lead to monotone convergence for various classes of nonlinear partial differential equations In Chapter II the utility of conservation technique is shown These techniques are suggested by physical principles In Chapter III it is shown that dynamic programming applied to variational problems leads to interesting classes of nonlinear partial differential equations In Chapter IV this is investigated in greater detail In Chapter V we show that the use of a transformation suggested by dynamic programming leads to a new method of successive approximations

Duffy, 2004-07-15 Transform methods provide a bridge between the commonly used method of separation of variables and numerical techniques for solving linear partial differential equations While in some ways similar to separation of variables transform methods can be effective for a wider class of problems Even when the inverse of the transform cannot be found and

Numerical Solution of Partial Differential Equations K. W. Morton, D. F. Mayers, 1994-10-20 Partial differential equations are the chief means of providing mathematical models in science engineering and other fields Generally these models must be solved numerically This book provides a concise introduction to standard numerical techniques ones chosen on the basis of their general utility for practical problems The authors emphasise finite difference methods for simple examples of parabolic hyperbolic and elliptic equations finite element finite volume and spectral methods are discussed briefly to see how they relate to the main theme Stability is treated clearly and rigorously using maximum principles energy methods and discrete Fourier analysis Methods are described in detail for simple problems accompanied by typical graphical results A key feature is the thorough analysis of the properties of these methods Plenty of examples and exercises of varying difficulty are supplied The book is based on the extensive teaching experience of the authors who are also well known for their work on practical and theoretical aspects of numerical analysis It will be an excellent choice for students and teachers in mathematics engineering and computer science departments seeking a concise introduction to the subject

The Numerical Solution of Partial Differential Equations by Closed Difference Methods William Allan Murray, 1962 The availability of powerful digital computers has stimulated new interest in solving partial differential equations numerically Closed difference methods are discussed in this thesis by closed

we mean that the solution is completed in a predetermined number of steps For completeness the difference operators needed are defined and difference series for derivatives are derived in this thesis Before employing them in the numerical solution of partial differential equations we illustrate their use in the simpler context of ordinary differential equations The analytic properties of partial differential equations are discussed briefly since these properties help to determine what numerical technique should be used in a given problem The difference analogue of a partial differential equation has however its own properties and difficulties properties and difficulties not encountered in the analytic solution An eminent example of this type of difficulty is the phenomenon of instability it is possible to translate a well posed partial differential equation problem into a badly posed difference problem This phenomenon is discussed briefly in general terms and more fully in the case of the heat equation and the equation The latter is investigated in detail the analytic 5x solution is obtained and the numerical solution undertaken Matrix methods for solving linear elliptic systems are discussed in detail These methods are only valid if the boundary is a rectangle with sides parallel to the axes but a procedure for handling non rectangular boundaries which retains the best qualities of closed methods is suggested Means by which singularities in boundary data are handled are also considered
