Dumas,1952      *Synthesis of Unity-gain Complex-zero Rc Networks* Charles F. White,NAVAL RESEARCH LAB WASHINGTON D C.,1963 Resistance capacitance networks provide filter ing insertion loss variation with frequency For prescribed voltage transfer functions containing complex zeros and negative real poles known synthesis procedures lead to RC networks exhibiting an undesirable frequency independent loss A new network synthesis procedure is set forth and applied to obtain a four 7 element RC networks exhibiting damped complex zeros and b a 6 element RC network with undamped complex zeros of transmission When these new networks are applicable the prescribed transfer function is realized exactly including the unity multi plicative constant In addition these networks have fewer elements than previous realizations Author      **Synthesis of Active RC Networks** Sanjit Kumar Mitra,1962      **Synthesis of Some Distributed RC Networks** Cassius A. Hesselberth,1963 A certainibuted RC structure can be used to obtain rational open circuit transfer impedances In addition one of the driving point impedances turns out to be rational Hence one of the open circuit voltage transfer functions is also rational Furthermore by considering various subcircuits and distributions of resistance and capacitance it is possible to realize other ra tional open circuit voltage transfer functions and rational short circuit transfer admittances Connecting these networks in series extends the class of functions realizable with such struc tures Using a basic distributed RC network along with an external resistor and capacitor it is possible to obtain a null in the open circuit voltage transfer function over a certain re stricted range of frequencies However the shape of the notch is shown graphically to be a function of the null frequency A lossy dielec tric in the distributed network is found to shift this range of frequencies upwards and alter the notch characteristics in much the same way as in the low pass filter Author      **Transfer Matrix Synthesis Using Active RC Networks** Dov Hazony,R. D. Joseph,1965 Necessary conditions are established for the voltage transfer matrix of a transformerless grounded network composed of ideal resistors inductors capacitors RLC and grounded unity gain amplifiers These conditions are also shown to be sufficient for realization as the voltage transfer matrix of a transformerless grounded network containing RC and not more than one grounded unity gain amplifier per matrix row Similar necessary and sufficient conditions are presented for transformerless grounded input nongrounded output networks composed of these same passive and active elements The grounded input nongrounded output case requires not more than two grounded unity gain amplifiers per matrix row for its synthesis In the two port nongrounded case a special procedure makes it possible to realize the transfer function by the proper connection of two identical threeterminal networks Author

The material presented here provides a means for synthesis of networks containing uniformly distributed RC elements. After transforming the desired transfer function into a function rational in  $W$  the superscript square root of  $sRC$  state variable synthesis methods are applied to obtain a model containing elements with transfer functions of the form  $1/W$ . A circuit is then presented for the  $1/W$  block along with error analysis and design procedures for use in construction of the model. The elements of the synthesis procedures of Wyndrum and O Shea are presented for comparison. Furthermore synthesis of functions rational in  $W$  and  $\theta$  square root of  $s$  is discussed with circuits provided to realize the  $1/\theta$  block. Examples are presented to illustrate the use of the material in lumped distributed synthesis and in simulation of the solutions to partial differential equations of the parabolic class.
