The Periodical Vehicle Routing Problem: Research Overview and Practical Application to a South German Fast Food Restaurant Claus Friedrich, 2006-03-29 Diploma Thesis from the year 2005 in the subject Business economics General grade 1.3 University of Augsburg language English abstract In the middle of May 1997 Gerd Raupeter CEO of McDonald's Deutschland Inc Mc Donald's Germany Inc had to announce that some restaurants were sold out of shrimps¹ The keen customer's demand for this kind of seafood already exceeded the expected forecasts one week after starting the ongoing Fisch Wochen fish weeks mission As these circumstances highlighted an accurate product choice for the fast food corporation Mr Raupeter has nevertheless been pleased about it Otherwise such an awkward situation could be prevented by

developing a demand driven scheduling for each restaurant in the future The Periodic al Vehicle Routing Problem PVRP seems to be a tailor made solution for the reason that exact planning has to be done and delivery routes must be constructed over a period of time for example multiple days Observations and analyzes in the literature in most of the industries deal with a constant demand for goods and with only one good Moreover the one of a kind client prevails But for the application of the PVRP to the gastronomy there are some exceptions to be considered As this paper presents a solution approach of the delivery problem for the fast food industry in South Germany there are products to be transported consisting of diverse components Although there are nearly identical opening hours the eating places the clientele to be delivered due to their irregular demand for food and beverages are varying from the unique purchaser Another singularity lies in the conformity of the foodstuff which is reflected in the comparability of each restaurant Therefore the enduring solution approach will be done in a sample of some fast food restaurants This paper herein is organized as follows In the second and third chapter various theories that could lead depots how to organize its delivery are reviewed with an emphasis on the Vehicle Routing Problem VRP as well as the PVRP

The Vehicle Routing Problem Paolo Toth,Daniele Vigo,2002 In the field of combinatorial optimization problems the Vehicle Routing Problem VRP is one of the most challenging Defined more than 40 years ago the problem involves designing the optimal set of routes for fleets of vehicles for the purpose of serving a given set of customers Interest in VRP is motivated by its practical relevance as well as its considerable difficulty

The Vehicle Routing Problem on Tree Networks Roshan Kumar, 2011 The Vehicle Routing Problem VRP is a classical problem in logistics that has been well studied by the operations research and transportation science communities VRPs are defined as follows Given a transportation network with a depot a set of pickup or delivery locations and a set of vehicles to service these locations find a collection of routes starting and ending at the depot such that i the customer's demand at a node is satisfied by exactly one vehicle ii the total demand satisfied by a vehicle does not exceed its capacity and iii the total distance traveled by the vehicles

is minimized This problem is especially hard to solve because of the presence of sub tours which can be exponential in number In this dissertation a special case of the VRP is considered where the underlying network has a tree structure TVRP Such tree structures are found in rural areas river networks assembly lines of manufacturing systems and in networks where the customer service locations are all located off a main highway Solution techniques for TVRPs that explicitly consider their tree structure are discussed in this dissertation For example TVRPs do not contain any sub tours thereby making it possible to develop faster solution methods The variants that are studied in this dissertation include TVRPs with Backhauls TVRPs with Heterogeneous Fleets TVRPs with Duration Constraints and TVRPs with Time Windows Various properties and observations that hold true at optimality for these problems are discussed Integer programming formulations and solution techniques are proposed Additionally heuristic methods and conditions for lower bounds are also detailed Based on the proposed methodology extensive computational analysis are conducted on networks of different sizes and demand distributions

A Route-splitting Approach to the Vehicle Routing Problem and a Lotsizing and Scheduling Problem with Sequence-dependent Setup Costs Sungmin Kang,1994 Distance-constrained Vehicle Routing Problem Samira Almoustafa,2013 The asymmetric distance constrained vehicle routing problem ADVRP looks at finding vehicle tours to connect all customers with a depot such that the total distance is minimised each customer is visited once by one vehicle every tour starts and ends at a depot and the travelled distance by each vehicle is less than or equal to the given maximum value We present three basic results in this thesis In the first one we present a general flow based formulation to ADVRP It is suitable for symmetric and asymmetric instances It has been compared with the adapted Bus School Routing formulation and appears to solve the ADVRP faster Comparisons are performed on random test instances with up to 200 customers We reach a conclusion that our general formulation outperforms the adapted one Moreover it finds the optimal solution for small test instances quickly For large instances there is a high probability that an optimal solution can be found or at least improve upon the value of the best feasible solution found so far compared to the other formulation which stops because of the time condition This formulation is more general than Kara formulation since it does not require the distance matrix to satisfy the triangle inequality The second result improves and modifies an old branch and bound method suggested by Laporte et al in 1987 It is based on reformulating a distance constrained vehicle routing problem into a travelling salesman problem and uses the assignment problem as a lower bounding procedure In addition its algorithm uses the best first strategy and new branching rules Since this method was fast but memory consuming it would stop before optimality is proven Therefore we introduce randomness in choosing the node of the search tree in case we have more than one choice usually we choose the smallest objective function If an optimal solution is not found then restart is required due to memory issues so we restart our procedure In that way we get a multistart branch and bound method Computational experiments show that we are able to exactly solve large test instances with up to 1000 customers As far as we know those instances are much larger than

instances considered for other VRP models and exact solution approaches from recent literature. So despite its simplicity this proposed algorithm is capable of solving the largest instances ever solved in literature. Moreover this approach is general and may be used in solving other types of vehicle routing problems. In the third result we use VNS as a heuristic to find the best feasible solution for groups of instances. We wanted to determine how far the difference is between the best feasible solution obtained by VNS and the value of optimal solution in order to use the output of VNS as an initial feasible solution upper bound procedure to improve our multistart method. Unfortunately based on the search strategy best first search using a heuristic to find an initial feasible solution is not useful. The reason for this is because the branch and bound is able to find the first feasible solution quickly. In other words in our method using a good initial feasible solution as an upper bound will not increase the speed of the search. However this would be different for the depth first search. However we found a big gap between VNS feasible solution and an optimal solution so VNS can not be used alone unless for large test instances when other exact methods are not able to find any feasible solution because of memory or stopping conditions.

Heuristics for the vehicle routing problem with multiple deliverymen Michael Huemer, 2013-09-02 Masterarbeit aus dem Jahr 2011 im Fachbereich BWL Beschaffung Produktion Logistik Note Sehr gut Karl Franzens Universität Graz Produktion und Logistik Sprache Deutsch Abstract Der Hauptbestandteil dieser Arbeit ist das Testen verschiedener lokaler Suchoperatoren für eine Erweiterung des gutbekannten Vehicle Routing Problems. Diese erst vor kurzem eingeführte Erweiterung wurde notwendig um ein Routenplanungsproblem zu lösen das daraus bestand Getrönke und Tabakwaren in dichtbesiedelten Großstädten in Brasilien auszuliefern. Es wurde nun versucht herauszufinden welche der VRPTW Operatoren geeignet sind um das Vehicle Routing Problem with Time Windows and Multiple Deliverymen VRPTWMD möglichst gut zu lösen. Insgesamt wurden vier Operatoren implementiert wobei Relocate und Ejection Chains auf die Routenminimierung abzielen und Cross bzw 2 opt entsprechend die gefahrene Distanz verringern sollten. Um die Operatoren zu testen wurden die besten Startlösungen mit der von Solomon entwickelten I1 Einfageheuristik generiert. Die Erkenntnisse aus den Tests wurden schließlich dazu verwendet eine best performance Variante zu entwickeln welche anhand der Solomon Instanzen R101 bis R112 getestet wurde. Die Ergebnisse der Tests befinden sich am Ende der Arbeit.

The Vehicle Routing Problem with time windows is a well studied problem in literature. The extension to Vehicle Routing Problem with Time Windows and Multiple Deliverymen VRPTWMD has been proposed to solve a delivery problem of commodities like beverages and tobacco in highly populated areas in Brazil. This rather new problem structure in the VRPTW context is the main subject of the work. In this thesis the aim is to find out which operators used for VRP are most suitable for the VRPTWMS. Relocate and Ejection Chain operators were tested for truck and deliverymen reduction. Cross and 2 opt were implemented to reduce distance. The Solomon I1 insertion heuristic was used to obtain starting solutions for the tests and the final version of the algorithm proposed. To complete this work several tests have been performed and the results of the algorithm running Solomon R101 R112 instances can be found

The book draws from a variety of sources including the traveling salesman problem TSP and graph theory which are used and studied by operations research engineers computer scientists and mathematicians. In the last ten years or so there has been extensive coverage of arc routing problems in the research literature especially from a graph theory perspective however the field has not had the benefit of a uniform systematic treatment. With this book there is now a single volume that focuses on state of the art exposition of arc routing problems that explores its graph theoretical foundations and that presents a number of solution methodologies in a variety of application settings. Moshe Dror has succeeded in working with an elite group of ARC routing scholars to develop the highest quality treatment of the current state of the art in arc routing.
