Optimal Physical Activity across the Lifespan for People of All Abilities Ronald F. Zernicke, David Arthur Hart. Humans evolved to be mobile within the boundary conditions of Earth, and many biological and physiologic systems depend on mechanical loading to maintain integrity during growth and maturation, during skeletal maturity, and during the aging process. These systems subscribe to the "use it or lose it" principle and thus require continual use to maintain integrity. Given that premise, considerable basic and clinical research efforts have been directed at optimizing the effectiveness and positive impact of exercise on sports performance and the well-being of those with intact systems. However, those with disabilities or compromised abilities also benefit from exercise protocols, and there exists a need to focus attention on these populations as well. Given the myriad of biological and physiological systems that benefit from exercise and mechanical loading, there is a need for all humans of varying abilities to not only maintain the integrity of their health but to attempt to optimize it, recognizing that optimizing each person's health across the stages of the life cycle may require different exercise protocols dependent on stage of life, sex, genetics, and other individualized variables. For those with physical disabilities, embracing and maintaining such exercise protocols may be challenging, but expanded research, translation of findings, and integration of the outcomes into everyday life to enhance the health and well-being of this significant population are needed going forward.

Novel technologies in the diagnosis and management of sleep-disordered breathing, volume III Ding Zou, Henri Korkalainen, 2026-02-09
Sleep disordered breathing (SDB) ranging from habitual snoring to severe obstructive sleep apnea (OSA) is highly prevalent and represents a growing global healthcare burden. Besides disrupting sleep, SDB leads to detrimental outcomes such as excessive daytime sleepiness, neurocognitive impairment, and increased cardiometabolic morbidities. In the Research Topic Volume I and II, we observed the technology developments that enable rapid innovations in the field of SDB. Simple diagnostic methods and novel disease management solutions strongly suggest that the SDB diagnostics and management are moving from a one-size-fits-all approach to precision sleep medicine. To build on the success of Volume I and Volume II, presenting outstanding works in the field, the Volume III aims to expand on the recent developments in the field of sleep medicine. Possible topics of interest include, but are not limited to:
1 Novel insights on pathophysiology of OSA from physiological signals collected in standard sleep studies
2 Novel signal acquisition and sensor technologies
3 Alternative polysomnography metrics and analyses
4 Minimally invasive data collection for screening and long-term follow-up of SDB
5 Artificial intelligence and machine learning based signal analysis approach
6 Biomarkers and phenotyping based prediction models on treatment outcomes
7 Big data approaches and telemedicine in sleep medicine
8 Emerging technologies to provide alternative treatment options for better treatment adherence and clinical outcomes
9 Disease management approaches encompass phenotyping and endotyping for better patient characterization including disease severity, daytime symptoms, as well as comorbidity conditions
10 Patient-reported outcome measures, assessment, and sleep disparities studies
We are interested in original works, protocols, literature reviews, meta-analyses, perspectives, and expert consensus related to sleep disorders, with a specific focus on SDB.
