Robust Control of Uncertain Dynamic Systems Rama K. Yedavalli, 2013-12-05 This textbook aims to provide a clear understanding of the various tools of analysis and design for robust stability and performance of uncertain dynamic systems In model based control design and analysis mathematical models can never completely represent the real world system that is being modeled and thus it is imperative to incorporate and accommodate a level of uncertainty into the models This book directly addresses these issues from a deterministic uncertainty viewpoint and focuses on the interval parameter characterization of uncertain systems Various tools of analysis and design are presented in a consolidated manner This volume fills a current gap in published works by explicitly addressing the subject of control of dynamic systems from linear state space framework namely using a time domain matrix theory based approach This book also Presents and formulates the robustness problem in a linear state space model framework Illustrates various systems level methodologies with examples and applications drawn from aerospace electrical and mechanical engineering Provides connections between lyapunov based matrix approach and the transfer function based polynomial approaches Robust Control of Uncertain Dynamic Systems A Linear State Space Approach is an ideal book for first year graduate students taking a course in robust control in aerospace

Validation, Identification, and Control of Robust Control Uncertainty Models Sundeep Rangan,1997 On the Formulation of a Minimal Uncertainty Model for Robust Control with Structured Uncertainty National Aeronautics and Space Administration (NASA),2018-07-09 In the design and analysis of robust control systems for uncertain plants representing the system transfer matrix in the form of what has come to be termed an M delta model has become widely accepted and applied in the robust control literature The M represents a transfer function matrix M s of the nominal closed loop system and the delta represents an uncertainty matrix acting on M s The nominal closed loop system M s results from closing the feedback control system K s around a nominal plant interconnection structure P s The uncertainty can arise from various sources such as structured uncertainty from parameter variations or multiple unsaturated uncertainties from unmodeled dynamics and other neglected phenomena In general delta is a block diagonal matrix but for real parameter variations delta is a diagonal matrix of real elements Conceptually the M delta structure can always be formed for any linear interconnection of inputs outputs transfer functions parameter variations and perturbations However very little of the currently available literature addresses computational methods for obtaining this structure and none of this literature addresses a general methodology for obtaining a minimal M delta model for a wide class of uncertainty where the term minimal refers to the dimension of the delta matrix Since having a minimally dimensioned delta matrix would improve the efficiency of structured singular value or multivariable stability margin computations a method of obtaining a minimal M delta would be useful Hence a method of obtaining the interconnection system P s is required A generalized procedure for obtaining a minimal P delta structure for systems with real parameter variations is presented Using this model the minimal M delta model can then be easily obtained by closing the feedback loop The procedure involves representing the system in a cascade form state space realization determining the minimal uncertainty matrix Robust Control With Matlab.
