Unbounded Linear Operators Seymour Goldberg, 2006-01-01 This volume presents a systematic treatment of the theory of unbounded linear operators in normed linear spaces with applications to differential equations Largely self contained it is suitable for advanced undergraduates and graduate students and it only requires a familiarity with metric spaces and real variable theory After introducing the elementary theory of normed linear spaces particularly Hilbert space which is used throughout the book the author develops the basic theory of unbounded linear operators with normed linear spaces assumed complete employing operators assumed closed only when needed Other topics include strictly singular operators operators with closed range perturbation theory including some of the main theorems that are later applied to ordinary differential operators and the Dirichlet operator in which the author outlines the interplay between functional analysis and hard classical analysis in the study of elliptic partial differential equations In addition to its readable style this book s appeal includes numerous examples and motivations for certain definitions and proofs Moreover it employs simple notation eliminating the need to refer to a list of symbols

operators The theory of Fredholm operators is emphasized and used as an important tool in the study of the spectral theory of non Archimedean operators Explicit descriptions of the spectra of some operators are worked out Moreover detailed background materials on non Archimedean valued fields and free non Archimedean Banach spaces are included for completeness and for reference The readership of the book is aimed toward graduate and postgraduate students mathematicians and non mathematicians such as physicists and engineers who are interested in non Archimedean functional analysis Further it can be used as an introduction to the study of non Archimedean operator theory in general and to the study of spectral theory in other special cases
