March 1966 Observations of the Galactic Spur in the 20 to 40 MHz Range Donald A. Guidice, 1967 In March 1966 observations were made at the Arecibo Ionospheric Observatory to map the region of the Galactic Spur North Polar Spur in the 20 40 MHz range Simultaneous observations were made at 38 75 33 45 26 70 and 22 30 MHz using a log periodic feed a four way power divider and individual null balancing radiometers Antenna half power beamwidths were roughly 2 0 degrees at 38 75 and 3 3 degrees at 22 30 MHz The observations were confined to the 2300 0500 local time period to minimize ionospheric effects The area observed was between 12h and 16h right ascension 32 degrees and 2 degrees declination Results are given in the report

selected pole star with a star tracker co aligned to the roll axis and by careful geometric alignment of the optical elements
and dynamic balancing the payload the desired accuracy was achieved Further refinement in position was obtained from the

particular focus on the Earth s atmosphere and climate It covers the basics of the radiative transfer of sunlight treating
absorption and scattering and the transfer of the thermal infrared The examples included show how the solutions of the
radiative transfer equation are used to evaluate changes in the Earth s energy budget due to changes in atmospheric
composition how these changes lead to climate change and also how remote sensing can be used to probe the thermal
