Adaptive Computing in Design and Manufacture VI I.C. Parmee, 2011-06-27

The Adaptive Computing in Design and Manufacture conference series has become a well established, largely application oriented meeting, recognised by several UK Engineering Institutions and the International Society of Genetic and Evolutionary Computing. The main theme of the series relates to the integration of evolutionary and adaptive computing technologies with design and manufacturing processes, whilst also taking into account complementary advanced computing technologies. Evolutionary and adaptive computing techniques continue to increase their penetration of industrial and commercial practice, as awareness of their powerful search, exploration and optimisation capabilities becomes ever more prevalent and increasing desk top computational capability renders stochastic population based search a far more viable proposition. There has been a significant increase in the development and integration of commercial software tools utilising adaptive computing technologies and the emergence of related commercial research and consultancy organisations supporting the introduction of best practice in terms of industrial utilisation. The book is comprised of selected papers that cover a diverse set of industrial application areas including engineering design and design environments and manufacturing process design, scheduling and control. Various aspects of search, exploration and optimisation are investigated in the context of integration with industrial processes, including multi objective and constraint satisfaction, development and utilization of meta models, algorithm and strategy development and human centric evolutionary approaches. The role of agent based and neural net technologies in terms of supporting search processes and providing an alternative simulation environment is also explored. This collection of papers will be of particular interest to both industrial researchers and practitioners, in addition to the academic research communities across engineering, operational research and computer science.

Soft Computing and Intelligent Systems Design Fakhreddine O. Karray, Clarence W. De Silva, 2004

Traditional artificial intelligence (AI) techniques are based around mathematical techniques of symbolic logic with programming in languages such as Prolog and LISP, invented in the 1960s. These are referred to as crisp techniques by the soft computing community. The new wave of AI methods seeks inspiration from the world of biology and is being used to create numerous real world intelligent systems with

the aid of soft computing tools These new methods are being increasingly taught at the upper end of the curriculum sometimes as an adjunct to traditional AI courses and sometimes as a replacement for them Where a more radical approach is taken and the course is being taught at an introductory level we have recently published Negnevitsky s book Karray and Silva will be suitable for the majority of courses which will be found at an advanced level Karray and de Silva cover the problem of control and intelligent systems design using soft computing techniques in an integrated manner They present both theory and applications including industrial applications and the book contains numerous worked examples problems and case studies Covering the state of the art in soft computing techniques the book gives the reader sufficient knowledge to tackle a wide range of complex systems for which traditional techniques are inadequate
