Cummings,1996-12-01      **Evolutionary Genetics** Charles W. Fox,Jason B. Wolf,2006-04-27 Charles Fox and Jason Wolf have brought together leading researchers to produce a cutting edge primer introducing readers to the major concepts in modern evolutionary genetics This book spans the continuum of scale from studies of DNA sequence evolution through proteins and development to multivariate phenotypic evolution and the continuum of time from ancient events that lead to current species diversity to the rapid evolution seen over relatively short time scales in experimental evolution studies Chapters are accessible to an audience lacking extensive background in evolutionary genetics but also current and in depth enough to be of value to established researchers in evolution biology

*Bioinformatics: Concepts, Methodologies, Tools, and Applications* Management Association, Information Resources,2013-03-31 Bioinformatics Concepts Methodologies Tools and Applications highlights the area of bioinformatics and its impact over the medical community with its innovations that change how we recognize and care for illnesses Provided by publisher      **The Theory of Evolution** Samuel M. Scheiner,David P. Mindell,2020-01-07 Darwin s nineteenth century writings laid the foundations for modern studies of evolution and theoretical developments in the mid twentieth century fostered the Modern Synthesis Since that time a great deal of new biological knowledge has been generated including details of the genetic code lateral gene transfer and developmental constraints Our improved understanding of these and many other phenomena have been working their way into evolutionary theory changing it and improving its correspondence with evolution in nature And while the study of evolution is thriving both as a basic science to understand the world and in its applications in agriculture medicine and public health the broad scope of evolution operating across genes whole organisms clades and ecosystems presents a significant challenge for researchers seeking to integrate abundant new data and content into a general theory of evolution This book gives us that framework and synthesis for the twenty first century The Theory of Evolution presents a series of chapters by experts seeking this integration by addressing the current state of affairs across numerous fields within evolutionary biology ranging from biogeography to multilevel selection speciation and macroevolutionary theory By presenting current syntheses of evolution s theoretical foundations and their growth in light of new datasets and analyses this collection will enhance future research and understanding      Concepts of Genetics William S. Klug,Michael R. Cummings,2003 This book is known for its clear writing style emphasis on concepts visual art program and thoughtful coverage of all areas of genetics The authors capture readers interest with up to date coverage of cutting edge topics and research The authors emphasize those concepts that readers should come to understand and take away with them not a myriad of details and exceptions that need to be memorized and are soon forgotten In addition to topics traditionally covered in genetics this book has increased coverage of genomics including proteomics and bioinformatics biotechnology and

contains more real world problems For anyone in biology agriculture or health science who is interested in genetics The Concept of Race in Natural and Social Science E. Nathaniel Gates,2014-05-01 Explores the concept of race The term race which originally denoted genealogical or class identity has in the comparatively brief span of 300 years taken on an entirely new meaning In the wake of the Enlightenment it came to be applied to social groups This ideological transformation coupled with a dogmatic insistence that the groups so designated were natural and not socially created gave birth to the modern notion of races as genetically distinct entities The results of this view were the encoding of race and racial hierarchies in law literature and culture How racial categories facilitate social control The articles in the series demonstrate that the classification of humans according to selected physical characteristics was an arbitrary decision that was not based on valid scientific method They also examine the impact of colonialism on the propagation of the concept and note that racial categorization is a powerful social force that is often used to promote the interests of dominant social groups Finally the collection surveys how laws based on race have been enacted around the world to deny power to minority groups A multidisciplinary resource This collection of outstanding articles brings multiple perspectives to bear on race theory and draws on a wider range of periodicals than even the largest library usually holds Even if all the articles were available on campus chances are that a student would have to track them down in several libraries and microfilm collections Providing of course that no journals were reserved for graduate students out for binding or simply missing This convenient set saves students substantial time and effort by making available all the key articles in one reliable source Authoritative commentary The series editor has put together a balanced selection of the most significant works accompanied by expert commentary A general introduction gives important background information and outlines fundamental issues current scholarship and scholarly controversies Introductions to individual volumes put the articles in context and draw attention to germinal ideas and major shifts in the field After reading the material even a beginning student will have an excellent grasp of the basics of the subject The Character Concept in Evolutionary Biology Günter P. Wagner,2000-10-31 Almost all evolutionary biologists indeed all biologists use particular features to study life These characteristics or features used by evolutionary biologists are used in a particular way to unravel a tangled evolutionary history document the rate of evolutionary change or as evidence of biodiversity Characters are the data of evolutionary biology and they can be employed differently in research providing both opportunities and limitations The Character Concept in Evolutionary Biology is about characters their use how different sorts of characters are limited and what are appropriate methods for character analysis Leading evolutionary biologists from around the world are contributors to this authoritative review of the character concept Because characters and the conception of characters are central to all studies of evolution and because evolution is the central organizing principle of biology this book will appeal to a wide cross section of biologists Focuses upon characters fundamental data for evolutionary biology Covers the myriad ways in which characters are defined described and distinguished Includes historical

morphological molecular behavioral and philosophical perspectives      **Biological Ontologies and Semantic Biology** John Hancock,2014-10-03 As the amount of biological information and its diversity accumulates massively there is a critical need to facilitate the integration of this data to allow new and unexpected conclusions to be drawn from it The Semantic Web is a new wave of web based technologies that allows the linking of data between diverse data sets via standardised data formats big data Semantic Biology is the application of semantic web technology in the biological domain including medical and health informatics The Special Topic encompasses papers in this very broad area including not only ontologies development and applications but also text mining data integration and data analysis making use of the technologies of the Semantic Web Ontologies are a critical requirement for such integration as they allow conclusions drawn about biological experiments or descriptions of biological entities to be understandable and integratable despite being contained in different databases and analysed by different software systems Ontologies are the standard structures used in biology and more broadly in computer science to hold standardized terminologies for particular domains of knowledge Ontologies consist of sets of standard terms which are defined and may have synonyms for ease of searching and to accommodate different usages by different communities These terms are linked by standard relationships such as is\_a an eye is\_a sense organ or part\_of an eye is part\_of a head By linking terms in this way more detailed or granular terms can be linked to broader terms allowing computation to be carried out that takes these relationships into account      **Concept Development and the Development of the God Concept in the Child** V.
