Cache-memory Interfaces in Compressed Memory Systems International Business Machines Corporation. Research Division. (IBMRD), Caroline D. Benveniste, Peter A. Franaszek, John T. Robinson, 2000 Abstract We consider a number of cache memory hierarchy design issues in systems with compressed random access memories C RAMs in which compression and decompression occur automatically to and from main memory Using a C RAM as main memory segments of main memory are stored in a compressed format and dynamically decompressed to handle cache misses at the next higher

level of memory Design of main memory directory structures and storage allocation methods in such systems are described elsewhere here we focus on issues related to cache memory interfaces In particular if the cache line size of the cache or caches to which main memory data is transferred is different than the size of the unit of compression in main memory bandwidth and latency problems can occur Another issue is that of guaranteed forward progress that is ensuring that modified lines can be written to the compressed main memory so that the system can continue operation even if overall compression deteriorates We study several approaches for solving these problems using trace driven analysis to evaluate alternatives
