The Digital Catapult and Productivity Stuart Parris, Anton Spisak, Louise Lepetit, Sonja Marjanovic, Salil Gunashekar, Molly Morgan Jones, 2015. The Digital Catapult is a national centre designed to advance rapidly the UK's best digital ideas and to help unlock new value from sharing closed and proprietary data. RAND Europe was commissioned by the Digital Catapult to conduct a study to develop a conceptual framework to understand the present and prospective contribution of the Digital Catapult's activities to the UK's economic productivity. We found that the Digital Catapult targets market and innovation inefficiencies that likely inhibit the rapid commercialisation and up take of data innovation across firms and industries. If not addressed, these barriers may well hinder the benefits that sharing closed and proprietary data sets and open innovation could deliver to productivity growth in the UK. The Digital Catapult has three main mechanisms of change through which it can unlock these efficiency barriers for different sectors, disciplines and organisational types by:

- i) enabling the development of core data infrastructure
- ii) increasing the absorptive capacity of organisations to derive the value from data, assimilate it and use it towards commercial ends and
- iii) convening expertise, providing leadership and fostering trust in key markets.

*Digital World Economy. An economic perspective on industry 4.0* Anton Nikitin, 2018-10-04. Seminar paper from the year 2018 in the subject Economics Innovation economics grade 1-3. University of Wuppertal Jean Monnet Chair for European Economic Integration. Language: English. Abstract: The elementary technology, the Internet, enabled the fourth industrial revolution. It changed the way people work. The collaboration in server clouds and the so-called Internet of Things allows even machines to interact. Many questions are still unsolved, e.g. the key technologies or their impact on the economic growth of economies. Nowadays, the transformation process is ongoing, while the impact of this technological change is still unclear. The McKinsey consulting group estimates that just the internet accounts for 21 percent of the GDP growth in major economies over the past five years. Furthermore, researchers mention that the share of ICT capital is often underestimated. In real terms, evaluated in prices in 1995, the share of ICT was roughly twice as high because of the continuously falling prices for ICT technologies and services. Fifteen years prior, the landscape of internet-driven companies seemed to stop the growth path after the Dotcom Crash. Before the expectations of immense productivity gains were higher than the possibilities of the technology. Also, the average employee was not ready to handle the challenges of digitalization, robotic, and the pace of technological

change In 2017 digitalization and automatization literature provides a wide range of IT specific but also managerial specific guidance Available economic papers refering to industry 4 0 are comparatively few And if available then are more focused on the impact of ICT on economic growth This paper tries to fill the gap to the point of a political economic perspective on industry 4 0 The object of interest is particularly productivity changes caused through digitalization and automatization which can be summed in the main driving forces of industry 4 0 The initial point of the investigation is the theoretical framework of the Cobb Douglas Production Function It will be converted in an applied model form which could be tested with the EU KLEMS database To justify a claim of this kind growth accounting estimates are used The traditional neoclassical methodology determines a contribution to growth from an exogenous technological change in the Solow residual estimate of total factor productivity TFP growth
