Imaging procedures have been used for many years and are becoming increasingly important in a number of medical disciplines This is due to recent technological advances primarily computerization The methods employed in CNS diagnostics are collectively referred to as neuroimaging and include procedures for investigating both cerebral morphology and cerebral function such as computed tomography CT magnetic resonance imaging MRI positron emission tomography PET and single photon emission computed tomography SPECT Topographic mapping of electroencephalograms EEG and evoked potentials represents one of the functional procedures and permits topographic imaging of EEG evoked potentials and magnetic fields The latter application includes not only magnetic fields evoked by stimuli relating to different sensory modalities but also endogenous and motor fields resulting from spontaneous brain magnetic activity as recorded by magnetoencephalograms MEG the magnetic complement of the EEG The advantage of recording electric and magnetic fields over other neuroimaging procedures is that these techniques are completely noninvasive and have extremely short analysis times in the millisecond range The aim of this book is to clarify the current state of this emerging technology to assess its potential for substantive contributions to brain research to delineate areas for further research and overall to envisage clinical applications in disciplines such as psychiatry neurology and neuropsychology *Event-related Slow Potentials of the Brain: Their Relations to Behavior* W. Cheyne McCallum, John Russell Knott, 1973 **The Oxford Handbook of Event-Related Potential Components** Steven J. Luck, Emily S. Slow Potential Changes in the Brain Haschke, Speckmann, 2012-11-28 DC potential changes comprising fast fluctuations and slow shifts represent objective concomitants of neuronal processes in the brain They can be recorded not only in animals but also in humans under various conditions As far as slow brain potentials are concerned exciting results have been detected with respect to their correlation to psychophysiological events Although a large amount of data has been accumulated by psychophysiological neurophysiologists and other scientists involved the neurophysiological basis of these field potentials is still not clear and remains controversial Scientists from European countries participated in an interdisciplinary symposium in the summer of 1990 July 2 to 6 at the Friedrich Schiller University in Jena which covered the field of slow brain potentials from the psychophysiological to the cellular level including glial cells and microenvironment From this conference the idea derived to present an up to date overview on important aspects of the field concerned The Introductory Remarks are given to elucidate what is thought to be a generator of slow potentials of the brain The large number of sources implications of the inverse problem to analyze field potentials are taken into account
