Weak Convergence Methods For Semilinear Elliptic Equations:

Weak Convergence Methods For Semilinear Elliptic Equations Jan Chabrowski,1999-10-19 This book deals with nonlinear boundary value problems for semilinear elliptic equations on unbounded domains with nonlinearities involving the subcritical Sobolev exponent The variational problems investigated in the book originate in many branches of applied science A typical example is the nonlinear Schrödinger equation which appears in mathematical modeling phenomena arising in nonlinear optics and plasma physics Solutions to these problems are found as critical points of variational functionals The main difficulty in examining the compactness of Palais Smale sequences arises from the fact that the Sobolev compact embedding theorems are no longer true on unbounded domains In this book we develop the concentration compactness principle at infinity which is used to obtain the relative compactness of minimizing sequences This tool combined with some basic methods from the Lusternik Schnirelman theory of critical points is to investigate the existence of positive symmetric and nodal solutions The book also emphasizes the effect of the graph topology of coefficients on the existence of multiple solutions

Uniqueness Theorems for Variational Problems by the Method of Transformation Groups Wolfgang Reichel,2004-05-13 A classical problem in the calculus of variations is the investigation of critical points of functionals $\text{cal } L$ on normed spaces V The present work addresses the question Under what conditions on the functional $\text{cal } L$ and the underlying space V does $\text{cal } L$ have at most one critical point A sufficient condition for uniqueness is given the presence of a variational sub symmetry i e a one parameter group G of transformations of V which strictly reduces the values of $\text{cal } L$ The method of transformation groups is applied to second order elliptic boundary value problems on Riemannian manifolds Further applications include problems of geometric analysis and elasticity

Concentration Compactness Kyril Tintarev,Karl-Heinz Fieseler,2007 Concentration compactness is an important method in mathematical analysis which has been widely used in mathematical research for two decades This unique volume fulfills the need for a source book that usefully combines a concise formulation of the method a range of important applications to variational problems and background material concerning manifolds non compact transformation groups and functional spaces Highlighting the role in functional analysis of invariance and in particular of non compact transformation groups the book uses the same building blocks such as partitions of domain and partitions of range relative to transformation groups in the proofs of energy inequalities and in the weak convergence lemmas

Concentration Compactness Cyril Tintarev,2020-02-10 Concentration compactness methods are applied to PDE s that lack compactness properties typically due to the scaling invariance of the underlying problem This monograph presents a systematic functional analytic presentation of concentration mechanisms and is by far the most extensive and systematic collection of mathematical tools for analyzing the convergence of functional sequences via the mechanism of concentration

Colloquium Mathematicum ,2010 **Variational Problems with Concentration** Martin F. Bach,2012-12-06 To start with we describe two applications of the theory to be

developed in this monograph Bernoulli's free boundary problem and the plasma problem Bernoulli's free boundary problem This problem arises in electrostatics fluid dynamics optimal insulation and electro chemistry In electrostatic terms the task is to design an annular condenser consisting of a prescribed conducting surface $\partial\Omega$ and an unknown conductor A such that the electric field Vu is constant in magnitude on the surface ∂A of the second conductor Figure 1.1 This leads to the following free boundary problem for the electric potential u $u = 0$ in $\Omega \setminus A$ $u = 0$ on $\partial\Omega$ $u = 1$ on ∂A $u \in Q$ on ∂A The unknowns are the free boundary ∂A and the potential u In optimal insulation problems the domain $\Omega \setminus A$ represents the insulation layer Given the exterior boundary $\partial\Omega$ the problem is to design an insulating layer $\Omega \setminus A$ of given volume which minimizes the heat or current leakage from A to the environment \mathbb{R}^n The heat leakage per unit time is the capacity of the set A with respect to n Thus we seek to minimize the capacity among all sets $A \subset \Omega$ of equal volume Differential and Integral Equations, 2006
