

## Gas Chromatography

### Phases

**Stationary**—a solid or a viscous liquid that lines a tube or column

**Mobile**—an inert gas like nitrogen or helium

### Analysis

Shows a peak that is proportional to the quantity of the substance present

Uses retention time instead of  $R_f$  for the qualitative analysis

## **Stationary Phases In Gas Chromatography:**

*Stationary Phases in Gas Chromatography* H. Rotzsche, 1991-08-21 The primary aim of this volume is to make the chemist familiar with the numerous stationary phases and column types with their advantages and disadvantages to help in the selection of the most suitable phase for the type of analytes under study The book also provides detailed information on the chemical structure physico chemical behaviour experimental applicability physical data of liquid and solid stationary phases and solid supports Such data were previously scattered throughout the literature To understand the processes occurring in the separation column and to offer a manual both to the beginner and to the experienced chromatographer one chapter is devoted to the basic theoretical aspects Further as the effectiveness of the stationary phase can only be considered in relation to the column type a chapter on different column types and the arrangement of the stationary phase within the column is included The secondary aim of this book is to stimulate the development of new and improved standardized stationary phases and columns in order to improve the reproducibility of separations as well as the range of applications

*Stationary Phases in Gas Chromatography* G. E. Baiulescu, V. A. Ilie, 2013-10-22 Stationary Phases in Gas Chromatography is a four chapter book that begins with a description of chromatographic column including its retention parameters mobile and stationary phases optimization of its process and types of column in gas chromatography Subsequent chapter focuses on the retention data and thermodynamic variables in the technique The last two chapters report the different types of stationary phases in gas chromatography as well as their selectivity

**Classification of Stationary Phases in Gas Chromatography** Elee Elizabeth Chong, 1982 Ultraviolet spectroscopy and dispersive solubility parameters correlated to the ratios of retention times have proven valuable in classification of gas chromatography stationary phases by the donor acceptor properties Iodine was directly dissolved into stationary phases and the absorption frequency shift of complexes was correlated with the carbon tetrachloride chloroform retention ratio on each stationary phases to examine the donor property The dispersive solubility parameters which were calculated from refractive indices of stationary phases were correlated with the m xylene p xylene retention ratio to examine the acceptor property of the stationary phases The results suggest that the relative retention time of chloroform with respect to carbon tetrachloride is a useful measure of the donor properties of stationary phases and that the ratio of retention times of m and p xylene is a good indicator of acceptor properties
