Vitamin-Binding Proteins Krishnamurti Dakshinamurti, Shyamala Dakshinamurti, 2013-07-29 Diverse in chemical nature water soluble and lipid soluble vitamins are essential micronutrients that react with specific protein entities and are transported to sites for participation in intracellular events both at the genomic and non genomic levels Thus metabolic pathways and intracellular signaling are influenced by vitamins or their derivatives through vitamin binding to specific proteins Vitamin Binding Proteins Functional Consequences examines the function of various vitamins based on this binding as well as their role as antioxidants leading to effects on intracellular mechanisms This book explores the resulting functional consequences at the level of cells tissues and organs as well as the neurological endocrine and immune systems The text addresses the effects that lead to both normal physiological function and pharmacological activity with significant therapeutic potential in a wide spectrum of disease processes Leading experts discuss various vitamins including the function of retinoids in development immunity and obesity the role of vitamin D in the immune system infectious processes and

cardiovascular disease and the effects of vitamins E C and K on the vascular system Chapters cover the therapeutic potential of the vitamin B6 vitamer pyridoxamine and the lipid soluble B1analogue benfotiamine They also describe various functions of biotin as well as gene transcriptional regulation through biotin and biotin binding proteins The text addresses folate receptor mediated therapeutics vitamin B12 derivatives in tumor targeting and implication of ascorbic acid in different disorders Expounding newer areas of vitamin function this book explores the interface of physiological vitamin function and pharmacological vitamin action offering a broad perspective of possible vitamin binding therapeutics

Weissig,2009-12-18 Efforts to describe and model the molecular structure of biological membranes go back to the beginning of the last century In 1917 Langmuir described membranes as a layer of lipids one molecule thick 1 Eight years later Gorter and Grendel concluded from their studies that the phospholipid molecules that formed the cell membrane were arranged in two layers to form a lipid bilayer 2 Danielli and Robertson proposed in 1935 a model in which the bilayer of lipids is sequestered between two monolayers of unfolded proteins 3 and the currently still accepted fluid mosaic model was proposed by Singer and Nicolson in 1972 4 Among those landmarks of biomembrane history a serendipitous observation made by Alex Bangham during the early 1960s deserves undoubtedly a special place His finding that exposure of dry phospholipids to an excess of water gives rise to lamellar structures 5 has opened versatile experimental access to studying the biophysics and biochemistry of biological phospholipid membranes Although during the following 4 decades biological membrane models have grown in complexity and functionality 6 liposomes are besides supported bilayers membrane nanodiscs and hybrid membranes still an indisputably important tool for membrane biophysicists and biochemists In vol II of this book the reader will find detailed methods for the use of liposomes in studying a variety of biochemical and biophysical membrane phenomena concomitant with chapters describing a great palette of state of the art analytical technologies *Cancer Research* ,2003
