Three Dimensional Computer Vision:

Three-dimensional Computer Vision Olivier Faugeras,1993 Three-dimensional Computer Vision Olivier Faugeras,1993 This monograph by one of the world's leading vision researchers provides a thorough mathematically rigorous exposition of a broad and vital area in computer vision the problems and techniques related to three dimensional stereo vision and motion The emphasis is on using geometry to solve problems in stereo and motion with examples from navigation and object recognition Faugeras takes up such important problems in computer vision as projective geometry camera calibration edge detection stereo vision with many examples on real images different kinds of representations and transformations especially 3 D rotations uncertainty and methods of addressing it and object representation and recognition His theoretical account is illustrated with the results of actual working programs **Three Dimensional Computer Vision** proposes solutions to problems arising from a specific robotics scenario in which a system must perceive and act Moving about an unknown environment the system has to avoid static and mobile obstacles build models of objects and places in order to be able to recognize and locate them and characterize its own motion and that of moving objects by providing descriptions of the corresponding three dimensional motions The ideas generated however can be used in different settings resulting in a general book on computer vision that reveals the fascinating relationship of three dimensional geometry and the imaging process **Three-Dimensional Computer Vision** Yoshiaki Shirai,2012-12-06 The purpose of computer vision is to make computers capable of understanding environments from visual information Computer vision has been an interesting theme in the field of artificial intelligence It involves a variety of intelligent information processing both pattern processing for extraction of meaningful symbols from visual information and symbol processing for determining what the symbols represent The term 3D computer vision is used if visual information has to be interpreted as three dimensional scenes 3D computer vision is more challenging because objects are seen from limited directions and some objects are occluded by others In 1980 the author wrote a book Computer Vision in Japanese to introduce an interesting new approach to visual information processing developed so far Since then computer vision has made remarkable progress various rangefinders have become available new methods have been developed to obtain 3D information knowledge representation frameworks have been proposed geometric models which were developed in CAD CAM have been used for computer vision and so on The progress in computer vision technology has made it possible to understand more complex 3 D scenes There is an increasing demand for 3D computer vision In factories for example automatic assembly and inspection can be realized with fewer constraints than conventional ones which employ two dimensional computer vision **Three-dimensional Computer Vision: Geometric Viewpoint** O. Faugeras, 3D Computer Vision Christian Wöhler,2012-07-23 This indispensable text introduces the foundations of three dimensional computer vision and describes recent contributions to the field Fully revised and updated this much anticipated new edition reviews a range of triangulation based methods including

linear and bundle adjustment based approaches to scene reconstruction and camera calibration stereo vision point cloud segmentation and pose estimation of rigid articulated and flexible objects Also covered are intensity based techniques that evaluate the pixel grey values in the image to infer three dimensional scene structure and point spread function based approaches that exploit the effect of the optical system The text shows how methods which integrate these concepts are able to increase reconstruction accuracy and robustness describing applications in industrial quality inspection and metrology human robot interaction and remote sensing

Three-Dimensional Machine Vision Takeo Kanade, 1987-03-31

A robot must perceive the three dimensional world if it is to be effective there Yet recovering 3 D information from projected images is difficult and still remains the subject of basic research Alternatively one can use sensors that can provide three dimensional range information directly The technique of projecting light stripes started to be used in industrial object recognition systems as early as the 1970s and time of flight laser scanning range finders became available for outdoor mobile robot navigation in the mid eighties Once range data are obtained a vision system must still describe the scene in terms of 3 D primitives such as edges surfaces and volumes and recognize objects of interest Today the art of sensing extracting features and recognizing objects by means of three dimensional range data is one of the most exciting research areas in computer vision

Three Dimensional Machine Vision is a collection of papers dealing with three dimensional range data The authors are pioneering researchers some are founders and others are bringing new excitement in the field I have tried to select milestone papers and my goal has been to make this book a reference work for researchers in three dimensional vision The book is organized into four parts 3 D Sensors 3 D Feature Extractions Object Recognition Algorithms and Systems and Applications Part I includes four papers which describe the development of unique capable 3 D range sensors as well as discussions of optical geometrical electronic and computational issues Mundy and Porter describe a sensor system based on structured illumination for inspecting metallic castings In order to achieve high speed data acquisition it uses multiple light stripes with wavelength multiplexing Case Jalkio and Kim also present a multi stripe system and discuss various design issues in range sensing by triangulation The numerical stereo camera developed by Altschuler Bae Altschuler Djik Tamburino and Woolford projects space coded grid patterns which are generated by an electro optical programmable spatial light modulator Kanade and Fuhrman present a proximity sensor using multiple LEDs which are conically arranged It can measure both distance and orientation of an object's surface

3D Computer Vision Christian Wöhler, 2009-07-28 This work provides an introduction to the foundations of three dimensional computer vision and describes recent contributions to the field which are of methodical and application specific nature Each chapter of this work provides an extensive overview of the corresponding state of the art into which a detailed description of new methods or evaluation results in application specific systems is embedded Geometric approaches to three dimensional scene reconstruction of Chapter 1 are primarily based on the concept of bundle adjustment which has been developed more than 100 years ago in

the domain of photogrammetry The three dimensional scene structure and the intrinsic and extrinsic camera parameters are determined such that the Euclidean backprojection error in the image plane is minimised usually relying on a nonlinear optimisation procedure In the field of computer vision an alternative framework based on projective geometry has emerged during the last two decades which allows to use linear algebra techniques for three dimensional scene reconstruction and camera calibration purposes With special emphasis on the problems of stereo image analysis and camera calibration these fairly different approaches are related to each other in the presented work and their advantages and drawbacks are stated In this context various state of the art camera calibration and self calibration methods as well as recent contributions towards automated camera calibration systems are described An overview of classical and new feature based correlation based dense and spatio temporal methods for establishing point correspondences between pairs of stereo images is given

An Introduction to 3D Computer Vision Techniques and Algorithms Boguslaw Cyganek, J. Paul Siebert, 2011-08-10

Computer vision encompasses the construction of integrated vision systems and the application of vision to problems of real world importance The process of creating 3D models is still rather difficult requiring mechanical measurement of the camera positions or manual alignment of partial 3D views of a scene However using algorithms it is possible to take a collection of stereo pair images of a scene and then automatically produce a photo realistic geometrically accurate digital 3D model This book provides a comprehensive introduction to the methods theories and algorithms of 3D computer vision Almost every theoretical issue is underpinned with practical implementation or a working algorithm using pseudo code and complete code written in C and MatLab There is the additional clarification of an accompanying website with downloadable software case studies and exercises Organised in three parts Cyganek and Siebert give a brief history of vision research and subsequently present basic low level image processing operations for image matching including a separate chapter on image matching algorithms explain scale space vision as well as space reconstruction and multiview integration demonstrate a variety of practical applications for 3D surface imaging and analysis provide concise appendices on topics such as the basics of projective geometry and tensor calculus for image processing distortion and noise in images plus image warping procedures An Introduction to 3D Computer Vision Algorithms and Techniques is a valuable reference for practitioners and programmers working in 3D computer vision image processing and analysis as well as computer visualisation It would also be of interest to advanced students and researchers in the fields of engineering computer science clinical photography robotics graphics and mathematics
