Solute Modelling In Catchment Systems:

Solute Modelling in Catchment Systems Stephen T. Trudgill, 1995-11-06 Stephen Trudgill presents an internationally authored research level text aimed at providing a synopsis of developments in solute modelling in catchment ecosystems over the last ten years The volume includes particular advances in solute modelling especially at the catchment scale emphasising the influences of weathering ecosystem processes and hydrological processes as well as the application of models and modelling principles The intended audience for the book is research scientists in cognate fields and postgraduate research workers although it is especially aimed at those interested in catchment systems It will also enable specialists to grasp the essentials of topics outside their own field The book will be of use in a management context as successful water quality management actions are often dependent upon the predictive success of models It will also show how models can be used to assess the sensitivity of solute production to environmental change and human influence such as land use change and variation in atmospheric inputs focussing upon surface catchments rather than groundwater and soil solutes

Mathematical Models of Small Watershed Hydrology and Applications Vijay P. Singh, Donald K. Frevert, 2002
Comprehensive account of some of the most popular models of small watershed hydrology and application of interest to all hydrologic modelers and model users and a welcome and timely edition to any modeling library **Integrated Methods in Catchment Hydrology** International Association of Hydrological Sciences, 1999 **Assessment of Non-Point Source Pollution in the Vadose Zone** Dennis L. Corwin, Keith Loague, Timothy R. Ellsworth, 1999-01-26 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 108 Non point source NPS pollution in the vadose zone simply defined as the layer of soil extending from the soil surface to the groundwater table is a global environmental problem Characteristically NPS pollutants are widespread and occasionally ubiquitous in extent thus making remediation efforts difficult and complex have the potential for maintaining a relatively long active presence in the global ecosystem and may result in long term chronic health effects in humans and other life forms Similar to other global environmental issues the knowledge and information required to address the problem of NPS pollutants in the vadose zone cross several technological and subdisciplinary lines spatial statistics geographic information systems GIS hydrology soil science and remote sensing Cooperation between disciplines and scientific societies is essential to address the problem Evidence of such cooperation was the jointly sponsored American Geophysical Union Chapman Soil Science Society of America SSSA Outreach Conference that occurred in October 1997 entitled Applications of GIS Remote Sensing Geostatistics and Solute Transport Modeling to the Assessment of Non Point Source Pollution in the Vadose Zone The objective of the conference and this book which was developed from the conference was to explore current multidisciplinary research for assessing NPS pollution in soil and groundwater resources *Environmental Foresight and Models* M.B. Beck, 2002-03-20 Policy makers and the public it has famously been said are more interested in the possibility of non linear dislocations and surprises in the behaviour of the

environment than in smooth extrapolations of current trends The International Task Force in Forecasting Environmental Change 1993 1998 dedicated its work to developing procedures of model building capable of addressing our palpable concerns for substantial change in the future This volume discusses the immense challenges that such structural change presents that the behaviour of the environment may become radically different from that observed in the past and investigates the potentially profound implications for model development Drawing upon case histories from the Great Lakes acidic atmospheric deposition and among others the urban ozone problem this discourse responds to a new agenda of questions For example What system of radar might we design to detect threats to the environment lying just beyond the horizon and Are the seeds of structural change identifiable within the record of the recent past Meticulously researched by leading environmental modellers this milestone volume engages vigorously with its subject and offers an animated account of how models can begin to take into consideration the significant threats and uncertainties posed by structural change
