The Barrel:

The Barrel and Box ,1909 *The Barrel Cortex of Rodents* Edward G. Jones,Irving T. Diamond,2013-06-29 The barrel area is a unique specialization of the cerebral cortex shared by many species of rodents and some marsupials in which the somatotopic map of the body surface receives direct morphological expression Here the homogeneous sheet of layer IV granule cells seen in most mammals is fractured into large archipelagos each representing one of the larger subdivisions of the contra lateral half body Within these larger domains are smaller aggregates of granule cells that contain the concentrated terminations of thalamocortical fibers bearing messages emanating from constellations of receptors located in finer subdivisions of a body part These smaller aggregates are particularly well defined in the representation of the face where they form a one to one representation of the sinus hairs or vibrissae and where they have been given the name barrels The first inklings of the unique structure of the parietal cortex of rodents came in the study of Droogleever Fortuyn 1914 who remarked on the presence in it of clouds of granule cells 0.5-1 mm in diameter which he thought were in some way associated with concentrations of nerve fibers Little attention however was paid to his observations Lorente de N 6 1922 later observed dense focal concentrations of afferent fiber ramifications in Golgi preparations of the mouse cortex calling them glomeruli and these can now be seen as the structures that form the hearts of the barrels and around which the granule cells concentrate
