## **Thysanoptera An Identification Guide:**

*Thysanoptera* Laurence Alfred Mound, Geoffrey Kibby, 1998 A number of species of Thysanoptera thrips are increasingly important crop pests in many parts of the world as well as in some cases being vectors of plant disease Communicating the known information about a species of organism is dependent on our ability to recognize or identify it accurately This book is a completely revised and rewritten edition of the standard widely used manual on these minute flying insects written by J M Palmer L A Mound and G J du Heaume and published in 1989 as CIE Guides to Insects of Importance to Man 2 Thysanoptera which provides a practical identification guide on a worldwide scale The previous version posed problems for students in terms of fluency in English knowledge of dichotomous keys However this thoroughly updated edition incorporates a new set of pictorial keys which have been developed and used very successfully for training courses at the International Institute of Entomology and which will greatly enhance the ability of the non specialist to identify thrips to species Individuals of these insects can usually be identified only by examination under a microscope often at high power Within each species individuals can vary in size colour and shape and their appearance can be altered by techniques used in preparation This booklet describes techniques used in the preparation of thrip specimens onto slides for identification and the means of identifying slide mounted specimens most commonly encountered It also introduces students to the biological diversity that is found amongst the Thysanoptera their economic importance in terms of both damaging and beneficial effects new identification techniques additional information and taxa glossary of technical terms notes on each genus described alphabetically within their families and subfamilies Supplementary keys to species are also given within four genera that include several pest species Caliothrips Frankliniella Scirtothrips and Thrips along with new distribution records which have occurred since the publication of the first edition It is an essential tool for applied entomologists and crop protection specialists involved in the control of crop pest thrips and thrip taxonomists

Dunn, 1998      Entomologist's Gazette , 1998      *Proceedings of the Entomological Society of Washington* Entomological Society of Washington, 2008 List of members in v 1 3 5 14      Biological Pathways to Improve Pest Control in Agriculture Manika Gupta, 2017-09-19 India is especially suitable for agricultural products its vast plains containing alluvial soil with rich natural contents The major economy of India is based on agricultural products The green revolution in India brought high hopes for Indian farmers Several new scientific information helped crop production to grow by leaps and bounds the more researches the more intricacies Further knowledge of pests makes scientists consider several new solutions The use of chemicals was immediately adopted to decimate the population of pests and at first good results were obtained But later on harmful effects of the pesticides became known It was realized later on that the regular use of chemicals in pesticides is extremely dangerous for human health Generally chemical pesticides are used to curb the harmful effects of insects and pests But the immediate gain of this process has an adverse effect on the environment in the long run Regular use of chemicals leads to insecticide resistance Then biodiversity is distributed by pest resurgence and pesticide residues So the immediate gain of one generation creates serious problems for the next generation To sustain agriculture towards its natural mode some new solutions are to be traced The solution to reduce pesticides is present in the preference for biological management Predators and parasitoids may be used as natural enemies In order to gain control over the thrips pests by less harmful means for the agricultural crops more research work needs to be done Certain other methods have to be explored in favour of the environment biodiversity and other useful flora and fauna We need to maintain the tritrophic interactions in which eating relationships between several species may be traced for biological control
